Abstract – Synthesis of the bicyclic core of zaragozic acids employing chiral furylglycerol (6) is described. Key steps are stereoselective construction of the C4 to C6 carbon centers by syn-dihydroxylation of alkene followed by reduction of carbonyl group in pyranone (8), introduction of ethynyl moiety as a carboxylic acid synthon at C3 by nucleophilic addition of lithium trimethylsilylacetylide to aldehyde (19), and bicyclic formation of dihydroxy ketone by ketalization, providing the 2,8-dioxabicyclo[3.2.1]octane core of zaragozic acids.

INTRODUCTION

The zaragozic acids and squalestatins, (Figure 1) fungal metabolites isolated independently by three groups,1-3 are potent inhibitors of squalene synthase (EC 2.5.1.21), that catalyzes the first committed enzyme of sterol biosynthesis. These compounds were shown to be not only inhibitors of mammalian squalene synthase,4 but also antifungal agents2a and ras-farnesyl-protein transferase inhibitors.1,5 Since inhibition of squalene synthase would be ideal from a therapeutic point of view, they are the most promising lead compounds for the development of new cholesterol-lowering drugs. These acids possess unusual and characteristic 4,6,7-trihydroxy-2,8-dioxabicyclo[3.2.1]octane-3,4,5-tricarboxylic acid core with six contiguous stereogenic centers. The core system is common to all members of the family with the only differences arising at C1 alkyl and C6 fatty acid side chains. This combination of potent biological activity and the complexity of their structures has stimulated a large number of synthetic
studies\textsuperscript{6} toward the core system and several total syntheses.\textsuperscript{7} As part of our continuing studies directed to the synthesis of physiologically active natural products using chiral furylcarbinols,\textsuperscript{8} we describe in detail a synthesis of the bicyclic core of zaragozic acids.\textsuperscript{9}

**RESULTS AND DISCUSSION**

The common core of zaragozic acids bears six contiguous stereogenic centers with citric acid unit, whose stereoselective construction seems to be a critical issue of the synthesis. The strategy for the synthesis of a model core (1) was envisaged to employ pyranone (3), readily accessible from chiral furylglycerol (4) by oxidative transformation. (Scheme 1) Syn-Dihydroxylation of 3 followed by reduction of ketone would occur from less hindered side to provide the corresponding 4,5,6-trihydroxypyran with the desired stereochemistries, and C\textsubscript{1} unit as carboxylic acid synthon can be introduced by stereoselective nucleophilic addition. Intramolecular ketalization of 2 would lead to the bicyclic core of zaragozic acids.

![Scheme 1](image)

Scheme 1. Retrosynthetic analysis of zaragozic acid core system

Synthesis of the key intermediate, highly oxygenated pyran (14) was carried out as follows. (Scheme 2) Chelation controlled addition reaction\textsuperscript{10} of 2-lithio-3,4-bis(methoxymethylxoyxymethyl)furan, prepared by treatment of 5 with BuLi, to (S)-2,3-O-isopropylideneglyceraldehyde\textsuperscript{11} in the presence of ZnBr\textsubscript{2} afforded a mixture of (2S, 3S)-glycerol (6) and its epimer in a ratio of 91:9, respectively. Ring enlargement of 6 by reaction with NBS\textsuperscript{12} in aq. THF gave lactol (7), which was treated with TBSCl in the presence of Ag\textsubscript{2}O to afford α-silyl ether (8) and β-ether in a ratio of 86:14, respectively. The stereochemistry at the anomeric position in 8 was deduced by the basis on our previous result.\textsuperscript{8b} Dihydroxylation of 8 with OsO\textsubscript{4} in the presence of pyridine occurred from the opposite side of adjacent silyl moiety to provide diol (9) quantitatively. Acid treatment of 9 in acetone brought about removal of MOM group followed by bis-ketalization to afford 10 in 63.9\% yield. Reduction of ketone (10) at C6 (zaragozic acid numbering) with NaBH\textsubscript{4} in MeOH at -78 °C gave the desired (6R)-alcohol (11) and its epimer in 90.9 and 9.0\% yields, respectively. Since the stereochemistries at C6 in both alcohols could not be deduced from their \textsuperscript{1}H NMR spectral analyses, the stereostructure of 11 was unambiguously determined by the X-Ray crystallographic analysis of desilylated compound (12). Protection of alcohol (11) as benzyl ether gave 13, which was
treated with TBAF to afford lactol (14). The observed stereoselectivity in the reduction of 10 at C6 position is rationalized that equatorial approach of hydride would favor over axial approach which generates the severe steric repulsion between hydride and bulky dioxolane ring at C4 position.

We first examined nucleophilic addition of C1 equivalent synthon, such as vinylmagnesium halide, ethynylmagnesium halide, trimethylsilyl cyanide etc, to lactol at C3 position in 14. In most cases formation of unidentified polar products together with starting material was found probably due to the lower reactivity of lactol with quaternary carbon at α position. Therefore, introduction of C1 unit to aldehyde followed by its transformation into the bicyclic core of zaragozic acids was devised as shown in Scheme 3. Lactol (14) was reduced with LiAlH4 to the open-chain diol (15). Compound (15) was converted to aldehyde (19) by sequential acetylation of the primary hydroxyl group in 15, silylation of the secondary hydroxyl group in 16, hydrolysis of acetate in 17, and oxidation of the primary hydroxyl group in 18 with Dess-Martin reagent in 75% overall yield.

Addition of C1 synthon to aldehyde (19) was carried out using several reagents under various conditions, and the selected results are shown in Table 1. More than 5 equiv. of reagent was used for the reaction because a stoichiometric amount of reagent gave only the recovery of starting material. The addition of vinylmagnesium bromide and lithium acetylide ethylenediamine complex to 19 gave a mixture of isomers in low yields with moderate selectivities (entries 1 and 3), whereas the reaction with ethynylmagnesium bromide and trimethylsilyl cyanide gave none of the desired adducts (entries 2 and 4). Pleasingly, the addition of lithium trimethylsilylacetylide gave a good yield of the adducts with moderate selectivity (entry 5). The best selectivity was recorded by lowering temperature. Highly diastereoselective
addition of lithium trimethylsilylacetylide in THF at -78 °C proceeded to afford propargylic alcohol (20) as a sole product in 94.4% (entry 6). Usage of additives did not give any improvement of both yield and selectivity.

Although the stereochemistry at C3 position in 20 could not be determined at this stage, its conversion to the bicyclic core of zaragozic acids was carried out (Scheme 4). Desilylation of terminal silyl moiety in 20 with K₂CO₃ followed by acetylation of newly created alcohol in 21 gave acetate (22) quantitatively. Selective removal of less hindered acetonide in 22 with FeCl₃-SiO₂¹⁴ afforded diol (23), which was then converted into ketone (25) by sequential acetylation of the primary alcohol in 23 and Dess-Martin oxidation of the secondary alcohol in 24 in 54% overall yield. Alkaline hydrolysis of diacetate (25) disappointingly gave a trace amount of the corresponding dihydroxyketone. In this regard, protecting
group in 21 was changed from acetyl to methoxymethyl group, which could be readily removed by acid treatment. Methoxymethylation of alcohol (21) gave quantitatively 26, which was further converted into 29 by the same sequences as above via diol (27) and monoacetate (28) in 50% overall yield. The stage was set for construction of the bicyclic core of zaragozic acids by ketalization. Although several bicyclic ketals could be formed upon acid cyclization of ketone (29), we hoped that acid-mediated cyclization would proceed under kinetic control to provide the desired 2,8-dioxabicyclo[3.2.1]octane system according to the useful observation by Myles. Treatment of 29 with a trace amount of conc. HCl in MeOH gave two unstable ketals in a ratio of ca. 3:2, which without purification were isolated by peracetylation to furnish the desired bicyclic compound (30) and its isomer (31) in 32.5 and 20.7% yields, respectively. The 3:2 ratio of the two ketal products did not change over 2 days time period. No other ketals were detected under this condition, even more prolonged reaction time. Assignment of the stereostructures of both bicyclic systems (30) and (31) was based on NMR experiments including HMQC, HMBC, and NOEDIFF. Diagnostic nOe enhancements for both 30 and 31 and also the coupling constants of $J_{6,7}=2.4\text{Hz}$ for 30 and $J_{6,7}=3.1\text{Hz}$ for 31 were observed, respectively. These NMR spectroscopic study provides strong evidence for the stereochemical confirmation and thus for the sense of diastereoselectivity of the nucleophilic addition process. Both bicyclic ketals (30) and (31) possess 2,8-dioxabicyclo[3.2.1]octane systems, however 31 has an incorrect substitution arrangement. The formation of product (31) is quite different from product distribution upon ketalization of similar polyoxy ketones reported by Myles and Armstrong. We supposed that initial hydrolysis of the acetonide at C5 position followed by ring closure of the hydroxyl at C5 onto the carbonyl at C1 might lead to a five-membered intermediate, whose second acetonide at C4 may be removed and subsequently competitive ring closure of each the hydroxyl at C3 and the hydroxyl attached at C4 might result in the formation of 30 or 31 based on the informative results in acid-mediated ketalization by Hashimoto and Armstrong. Although this discrepancy in product distribution would not be rationally explained, the relatively higher nucleophlicity of hydroxyl attached at C4 than that of hydroxyl at C3 owing to the inductive effect of ethynyl moiety could play a significant role in the second ring closure. For purposes of higher synthetic efficiency, introduction of C1 unit to lactol (14) was reexamined. (Scheme 5) Treatment of 20 equiv. of lithium trimethylsilylacetylide in THF at rt for 10 h gave propargylic alcohol (32) in 32.3% together with the recovery of starting material. To our delight, addition of 40 equiv. of trimethylsilylthynylmagnesium chloride proceeded diastereoselectively to afford propargylic alcohol (32) in 84.5% yield and none of its epimer was found. The stereochemistry at C3 position in 32 was elucidated by comparison of the acetate (22) obtained above. Desilylation of silyl moiety in 32 gave diol (33), whose selective acetylation of alcohol at C3 position followed by silylation of alcohol in 34 afforded silyl ether (35). Since 35 was found to be an epimer of 22 at C3 position by
their NMR spectral analyses, thus confirming that the stereostructure of 32 should be 3S. Inversion at C3 position in 32 was also carried out as follows. Attempts to directly invert the stereochemistry at C3 position by Mitsunobu reaction failed. Dess-Martin oxidation of 32 gave an inseparable mixture of hemiketals (36), in a ratio of 78:22, which was reduced with NaBH₄ to afford a mixture of the desired alcohol (37) and its epimer (33) in a ratio of 9:1 together with an unidentified product which might be deoxygenated compound. A mixture of 37 and 33 was converted into acetate (22) and its epimer (35) by the same procedure as above. Interestingly, hemiketals (36) was also prepared by the addition of lithium trimethylsilylacetylide (5 equiv.) to lactone (39), obtained by oxidation of lactol (14) with PCC, in THF at -78 °C in 73.5%.

The opposite diastereoselectivity observed in the nucleophilic addition reactions to aldehyde (19) and lactol (14) is of interest from a mechanistic point of view. Although several highly diastereoselective nucleophilic additions to open-chain α,β-dialkoxy aldehydes¹⁷ and higher carbohydrates¹⁸ are known, the stereochemical outcome of the reactions to polyalkoxy carbonyl compounds with quaternary carbons at α positions such as 19 and 14 is hardly predictable. These results can be explained by assuming an α-chelation transition state (A), which could be formed under relatively kinetic condition, in the addition to aldehyde (19) and either a δ-chelation¹⁹ transition state (B) or a Felkin-Anh transition state (C) in the addition to lactol (14). (Figure 2) The diastereoselectivity observed in the reduction of hemiketals (36) would be also rationalized by a Felkin-Anh transition state.

We have disclosed a new method for the construction of 2,8-dioxabicyclo[3.2.1]octane core of zaragozic acids employing the stereocontrolled modifications of chiral pyranone (8), accessible from (2S,3S)-
furylglycerol (6), and the diastereoselective introduction of ethynyl moiety as a carboxylic acid synthon to aldehyde (19) as key steps. Acid treatment of ketone (29) followed by peracetylation led to the formation of bicyclic core (30) together with incorrect substituted isomer (31). Application of 30 to the natural product would be possible by oxidation of the core substituents and introduction of side chains.

**EXPERIMENTAL**

IR spectra were obtained using a JASCO FT/IR-200 spectrophotometer. $^1$H and $^{13}$C NMR spectra were obtained on a JEOL JNM-LA270 ( $^1$H NMR: 270 MHz, $^{13}$C-NMR: 67.8 MHz) for solutions in CDCl$_3$, and chemical shifts are reported on the scale using TMS as an internal standard of 0.00 for $^1$H NMR spectra and CDCl$_3$ as an internal standard of 77.00 for $^{13}$C NMR spectra, respectively. JEOL JNM-LA500 ($^1$H NMR: 500 MHz, $^{13}$C NMR: 125 MHz) instrument was used only for the measurement of compounds (30) and (31). MS spectra were measured with a JEOL JMS-D300 spectrometer. Optical rotations were taken with a JASCO DIP-360 polarimeter. Elemental analyses were performed on a Yanaco-MT5. X-Ray measurement was carried out on a Rigaku AFC 7R diffractometer.

(2$S$,3$S$)-3-{$2'$-[3',4'-Bis(methoxymethyloxymethyl)furyl]}-1,2-O-isopropylidenglycerol (6). To a solution of 3,4-bis(methoxymethyloxymethyl)furan (5) (19.9 g, 92 mmol) in THF (300 mL) was added dropwise n-BuLi (1.69 M in hexane; 65.5 mL, 110 mmol) at –50 °C. The reaction mixture was stirred for 1 h at 0 °C, and ZnBr$_2$ (25 g, 110 mmol) was added portionwise. After being stirred for 30 min, a solution of (2$S$)-2,3-O-isopropylidenglyceraldehyde (8.0 g, 61.5 mmol) in THF (50 mL) was added dropwise at 0°C. The reaction was allowed to warm to rt and stirred for 10 h. The reaction was carefully quenched with saturated aqueous NH$_4$Cl solution in ice bath. The reaction mixture was concentrated, and a residue was extracted with AcOEt, and the combined organic layer was washed with brine. The organic layer was dried over Na$_2$SO$_4$ and evaporated to give a residue, which was chromatographed on silica gel (hexane/AcOEt=3:2) to afford a mixture of (2$S$, 3$S$)-glycerol (6) and (2$S$, 3$R$)-glycerol (91:9) as a colorless oil (11.3 g, 81.6 %). A small sample of mixture was purified carefully to give pure (2$S$, 3$S$)-glycerol (6). IR $\tilde{\nu}$ cm$^{-1}$: 3450 (OH). $^1$H NMR: $\tilde{\delta}$ 1.36 and 1.43 (each 3H, each s, CMe$_2$), 3.07 (1H, d, $J=3.7$ Hz, 3-OH), 3.38 and 3.40 (each 3H, each s, OMe), 4.12 and 4.20 (each 1H, each dd, $J=9.2$, 6.1 Hz, 1-H$_2$), 4.43 (1H, distorted q, $J=6.1$ Hz, 2-H), 4.48 (2H, s, 4'-CH$_2$), 4.54 and 4.61 (each 1H, each d, $J=12.2$ Hz, 3'-CH$_2$), 4.63 and 4.66 (each 2H, each s, OCH$_2$OMe), 4.83 (1H, dd, $J=6.1$, 3.7 Hz, 3-H), 7.39 (1H, s, 5'-H). HRMS m/z: Calcd for C$_{16}$H$_{26}$O$_8$ (M$^+$): 346.1627. Found: 346.1630. $[\alpha]_D^{25}+2.73^\circ$ (c=1.01, CHCl$_3$).

(2$S$)-6-Hydroxy-2-[(4$S$)-2',2'-dimethyl-1',3'-dioxolan-4'-yl]-4,5-bis(methoxymethyloxymethyl)-6H-pyran-3(2H)-one (7). To a stirred solution of the above mixture of glycerol (6.0 g, 17.3 mmol) and sodium acetate (1.85 g, 22.5 mmol) in aqueous THF (150 mL, THF/H$_2$O=4:1) was added portionwise NBS (4.0 g, 22.5 mmol) at 0 °C, and the resulting mixture was stirred for 30 min at the same temperature. The reaction mixture was successively treated with an excess of 10% KI solution and with saturated
Na$_2$S$_2$O$_3$ solution. After removal of the solvent, the aqueous solution was extracted with AcOEt, and the combined organic layer was washed with brine. The organic layer was dried over Na$_2$SO$_4$ and evaporated to give a residue, which was chromatographed on silica gel (hexane/AcOEt=3:2) to afford lactol (7) (5.6 g, 89.5%) as a colorless oil. IR cm$^{-1}$: 3400 (OH), 1690 (CO). $^1$H NMR: δ 1.38 and 1.44 (each 3H, each s, CMe$_2$), 3.36 and 3.39 (each 3H, each s, OMe), 3.98 (2H, dt, $J$=15.3, 6.7Hz, 5'-H$_2$), 4.28 and 4.37 (each 1H, each d, $J$=11.0 Hz, 4'-CH$_2$), 4.39 and 4.57 (each 1H, each d, $J$=14.0 Hz, 5'-CH$_2$), 4.45 (1H, d, $J$=4.9 Hz, 6-OH), 4.61 and 4.68 (each 2H, each s, OCH$_2$OMe), 4.71 (1H, ddd, $J$=6.7, 6.7, 3.1 Hz, 4'-H), 4.86 (1H, d, $J$=3.1 Hz, 2-H), 5.87 (1H, d, $J$=4.9 Hz, 6-H). HRMS m/z: Calcd for C$_{15}$H$_{23}$O$_5$ (M$^+$-15): 347.1342. Found: 347.1342. Anal. Calcd for C$_{16}$H$_{26}$O$_6$: C, 53.03; H, 7.53. Found: C, 53.05; H, 7.33. [α]$_D^{22}$ +4.66° (c=0.72, CHCl$_3$).

(2S,6S)-6-tert-Butyldimethylsiloxy-2-[(4'S)-2',2'-dimethyl-1',3'-dioxolan-4'-yl]-4,5-bis(methoxymethyl)-6H-pyran-3(2H)-one (8). A mixture of lactol (7) (6.78 g, 18.8 mmol), Ag$_2$O (30.5 g, 131 mmol), and TBSCl (19.7 g, 131 mmol) in DMF (250 mL) was stirred for 2 days at -30 °C. After insoluble material was filtered off through a Celite pad, the filtrate was concentrated to leave a residue, which was chromatographed on silica gel (hexane/AcOEt=3:2) to afford diol (8) (9.1 g, 87.5 mmol), and TBSCl (19.7 g, 131 mmol) in DMF (250 mL) was stirred for 2 days at -30 °C. After removal of the solvent, the residue was dissolved in pyridine (100 mL). To this solution was added a solution of NaH$_2$SO$_3$ (9.1 g, 87.5 mmol) in H$_2$O (100 mL), and the mixture was stirred for 12 h at rt. Evaporation of the solvent gave a residue, which was chromatographed on silica gel (hexane/AcOEt=3:2) to afford diol (9) (3.4 g, 99.2%) as a colorless oil. IR cm$^{-1}$: 1730 (CO), 3540 (OH). $^1$H NMR: δ 0.19 and 0.20 (each 3H, each s, SiMe$_2$), 0.92 (9H, s, CMe$_3$), 1.37 and 1.43 (each 3H, each s, CMe$_2$), 3.35 and 3.38 (each 3H, each s, OMe), 3.97 (2H, m, 5'-H$_2$), 4.22 and 4.60 (each 1H, each d, $J$=13.4 Hz, 5'-CH$_2$), 4.25 and 4.36 (each 1H, each d, $J$=11.0 Hz, 4'-CH$_2$), 4.61 and 4.64 (each 2H, each s, 2 OCH$_2$OMe), 4.67-4.74 (2H, m, 2-H, 4'-H), 5.81 (1H, s, 6-H). HRMS m/z: Calcd for C$_{32}$H$_{54}$O$_8$Si (M$^+$-15): 461.2207. Found: 461.2209. Anal. Calcd for C$_{22}$H$_{40}$O$_6$Si: C, 55.44; H, 8.46. Found: C, 55.30; H, 8.41. [α]$_D^{22}$ +12.5° (c=1.0, CHCl$_3$).

(2S,4S,5R,6S)-6-tert-Butyldimethylsiloxy-4,5-dihydroxy-4,5-bis(methoxymethyl)2-[(4'S)-2',2'-dimethyl-1',3'-dioxolan-4'-yl]-3,4,5,6-tetrahydro-2H-pyran-3-one (9). A stirred solution of enone (8) (3.2 g, 6.72 mmol) in Et$_2$O (150 mL) was added pyridine (2.2 mL, 26.9 mmol) and OsO$_4$ (2.2 g, 8.75 mmol) at room temperature. After the resulting mixture was further stirred for 12 h at rt. After removal of the solvent, the residue was dissolved in pyridine (100 mL). To this solution was added a solution of NaH$_2$SO$_3$ (9.1 g, 87.5 mmol) in H$_2$O (100 mL), and the mixture was stirred for 12 h at rt. Evaporation of the solvent gave a residue, which was chromatographed on silica gel (hexane/AcOEt=3:2) to afford diol (9) (3.4 g, 99.2%) as a colorless oil. IR cm$^{-1}$: 1730 (CO), 3540 (OH). $^1$H NMR: δ 0.19 and 0.26 (each 3H, each s, SiMe$_2$), 0.98 (9H, s, CMe$_3$), 1.38 and 1.39 (each 3H, each s, CMe$_2$), 3.30 and 3.38 (each 3H, each s, OMe), 3.30 and 4.21 (each 1H, each s, 4, 5-OH), 3.56 and 4.75 (each 1H, each d, $J$=10.4 Hz, 4'-CH$_2$), 3.68 (2H, s, 5'-CH$_2$), 4.01 (1H, dd, $J$=8.6, 6.1 Hz, 5'-HH$_2$), 4.13 (1H, ddd, $J$=8.6, 6.7 Hz, 5'-HH$_2$), 4.53 and 4.58 (each 1H, each d, $J$=6.7 Hz, OCH$_2$OMe), 4.58 (1H, ddd, $J$=6.7, 6.1, 4.3 Hz, 4'-H), 4.62 and 4.66 (each 1H, each d, $J$=6.7 Hz, OCH$_2$OMe), 4.66 (1H, d, $J$=4.3 Hz, 2-H), 5.25 (1H, s, 6-H). HRMS m/z: Calcd for C$_{32}$H$_{54}$O$_8$Si (M$^+$): 510.2494. Found: 510.2492. Anal. Calcd for C$_{22}$H$_{40}$O$_6$Si: C, 51.75; H, 8.29. Found: C, 51.67; H, 8.46. (2S,3S,4R,5S,6S,7R)-4-Benzoyloxy-3-tert-butyldimethylsiloxy-1,2-O-isopropylidenedioxy-9-trimeth-
A mixture of trimethylsilylacetylene (21) (218 mg, 0.315 mmol) and K$_2$CO$_3$ (57 mg, 0.410 mmol) in MeOH (10 mL) was stirred for 2 h at rt. After insoluble material was filtered off, the filtrate was condensed to give a residue, which was chromatographed on silica gel (hexane/AcOEt=17:3) to afford acetylene (21) (195 mg, 99.8%) as a colorless oil. IR cm$^{-1}$: 3300 (acetylene), 3500 (OH).

A solution of alcohol (21) (130 mg, 0.21 mmol), Ac$_2$O (79.3 µL, 0.84 mmol), a catalytic amount of DMAP, and pyridine (85 µL, 1.05 mmol) in CH$_2$Cl$_2$ (2.5 mL) was stirred for 12 h at rt. After quenching with saturated NH$_4$Cl solution, the mixture was extracted with AcOEt. The combined organic layer was washed with brine. The organic layer was dried over Na$_2$SO$_4$ and evaporated to give a residue, which was chromatographed on silica gel (hexane/AcOEt=9:1) to afford acetate (22) (138 mg, 99.4%) as a colorless oil. IR cm$^{-1}$: 1750 (CO), 3000 (acetylene).

A mixture of triacetonide (22) (194 mg, 0.29 mmol) and FeCl$_3$-SiO$_2$ complex (20 mg) in CHCl$_3$ (10 mL) was stirred for 2 h at rt. After insoluble material was filtered off through a Celite pad, the filtrate was concentrated to leave a residue, which was...
chromatographed on silica gel (hexane/AcOEt=7:3) to afford diol (23) (157 mg, 86.1 %) as a colorless oil. IR ∫ cm⁻¹: 1740 (CO), 3300 (acytenele), 3500 (OH). ¹H NMR: 0.03 and 0.18 (each 3H, each s, SiMe₂), 0.88 (9H, s, CMe₃), 1.43 and 1.45 (each 3H, each s, CMe₂), 1.54 and 1.55 (each 3H, each s, CMe₂), 2.11 (3H, s, COCH₃), 2.50-2.65 (2H, br s, 1, 2-OH), 2.50 (1H, d, J=2.4 Hz, 9-H), 3.86-4.97 (3H, m, 1-H₂, 2-H), 4.09 and 4.38 (each 1H, each d, J=9.8 Hz, 5 or 6-CH₂), 4.16 (1H, d, J=8.6 Hz, 4-H), 4.37 and 4.64 (each 1H, each d, J=10.4 Hz, 5 or 6-CH₂), 4.35 and 4.40 (1H, m, 3-H), 4.64 and 5.17 (each 1H, each d, J=12.2 Hz, PhCH₂), 5.83 (1H, d, J=2.4 Hz, 7-H), 7.25-7.34 (5H, m, Ar-H). HRMS m/z: Calcd for C₃₅H₄₇O₁₀Si (M⁺-15): 607.2937. Found: 607.2935. [α] D° 24 -24.7⁰ (c=0.86, CHCl₃).

(2S,3S,4R,5R,6S,7R)-1,7-Diacetoxy-4-benzylxylo-3-tert-butylidimethylsiloxyl-8-nonynon-2-ol-5,6-bis-[spiro-4'-(2',2'-dimethyl-1',3'-dioxolane)] (24). A solution of diol (23) (34 mg, 0.055 mmol), Ac₂O (7.7 µL, 0.082 mmol), a catalytic amount of DMAP, and pyridine (6.6 µL, 0.082 mmol) in CH₂Cl₂ (5 mL) was stirred for 1 h at rt. After quenching with saturated NaHCO₃ solution, the mixture was extracted with AcOET. The combined organic layer was washed with saturated NaCl solution and the mixture was extracted with AcOET. The combined organic layer was washed with brine. The organic layer was dried over Na₂SO₄ and evaporated to give a residue, which was chromatographed on silica gel (hexane/AcOEt=4:1) to afford acetate (24) (36 mg, 99.3 %) as a colorless oil. IR ∫ cm⁻¹: 1740 (CO), 3300 (acytenele) 3500 (OH). ¹H NMR: 0.00 and 0.07 (each 3H, each s, SiMe₂), 0.86 (9H, s, CMe₃), 1.42 and 1.45 (each 3H, each s, CMe₂), 1.55 (6H, s, CMe₂), 2.10 (6H, s, 2 ̋ COCH₃), 2.45 (1H, br s, 2-OH), 2.51 (1H, d, J=2.4 Hz, 9-H), 4.03 (1H, m, 2-H), 4.10 (1H, d, J=9.8 Hz, 5 or 6-C/H), 4.14 (1H, d, J=8.6 Hz, 4-H), 4.25-4.44 (4H, m, 1-H₂, 3-H, 5 or 6-C/H), 4.35 and 4.63 (each 1H, each d, J=9.8 Hz, 5 or 6-CH₂), 4.59 and 5.19 (each 1H, each d, J=12.2 Hz, PhCH₂), 5.84 (1H, d, J=2.4 Hz, 7-H), 7.26-7.30 (5H, m, Ar-H). Intramolecular ketalization of 29. A solution of ketone (29) (18 mg, 0.027 mmol) and a trace amount of conc. HCl in MeOH (2 mL) was heated at 50 °C for 2 days. After neutralization with saturated NaHCO₃ solution, the mixture was extracted with CHCl₃. The organic layer was dried over Na₂SO₄ and evaporated to give a residue, which was used for the next reaction without any purification. A solution of the crude product, Ac₂O (12.8 µL, 0.136 mmol), a catalytic amount of DMAP, and pyridine (13.2 µL, 0.163 mmol) in CH₂Cl₂ (2 mL) was stirred for 10 h at rt. After quenching with saturated NH₄Cl solution, the mixture was extracted with AcOEt. The combined organic layer was washed with brine. The organic layer was dried over Na₂SO₄ and evaporated to give a residue, which was chromatographed on silica gel (CH₂Cl₂/AcOEt=9:1) to afford (4R,5R,6R,7R)-7-acetoxy-4-(1R-1-acetoxypropynyl)-6-benzylxoy-4-hydroxy-1,4,5-tris(acetoxyethyl)-2,8-dioxabicyclo[3.2.1]octane (31) (3.0 mg, 20.7 %) as a colorless oil. IR cm⁻¹: 1750 (CO), 3280 (OH); ¹H NMR (500 MHz) δ 2.07, 2.08, 2.090 and 2.092 (each 3H, each s, 4 x CH₂CO), 2.59 (1H, d, J=2.4 Hz, -C=CH₂), 3.21 (1H, br s, OH), 3.80 and 4.41 (each 1H, each d, J=12.8 Hz, 3-H₂), 4.07 and 4.17 (each 1H, each d, J=12.2 Hz, CH₂OAc), 4.18 and 4.52 (each 1H, each d, J=11.3 Hz, CH₂OAc), 4.51 (1H, d, J=3.1 Hz, H-6), 4.55 and 4.66 (each 1H, each d, J=11.9 Hz, PhCH₂).
5.44 (1H, d, J=3.1 Hz, H-7), 5.97 (1H, d, J=2.4 Hz, CHOAc), 7.23-7.38 (5H, m, ArH); $^{13}$C NMR (125 MHz) □ 20.68, 20.70, 20.76, 22.82, 62.31, 63.07, 65.60, 66.35, 70.58, 72.50, 76.47, 77.73, 78.83, 81.76, 84.14, 102.82, 127.69, 128.07, 128.52, 137.13, 138.89, 139.66, 169.17, 170.05. HRMS m/z: Calcd for C$_{25}$H$_{27}$O$_2$ (M$^+$-15): 519.1500. Found: 519.1492. [α]$_d^{28}$ -6.6° (c=0.2, CHCl$_3$). Further elution with CH$_2$Cl$_2$/AcOEt (4/1) afforded (3R,4S,6R,7R)-7-acetoxy-6-benzylxy-3-ethynyl-4-hydroxy-1,4,5-triisopropylidenedioxy-2,8-dioxabicyclo[3.2.1]octane (30) (4.7 mg, 32.5 %) as a colorless oil.
