A READY ONE-POT PREPARATION FOR PTERIDINE AND
ISOXAZOLO[3,4-d]PYRIMIDINE DERIVATIVES

Abstract – Several new substituted pteridines and isoxazolo[5,4-d]pyrimidines
are easily obtained by an efficient one-pot procedure from the reaction of
N,N-dimethyldichloromethyleneiminium chloride (phosgeniminium chloride) with
the precursors β-enaminonitriles 2-amino-3-cyano-5-phenylpyrazine (5) and
5-amino-4-cyano-3-methylisoxazole (1), respectively.

The development of efficient and mild methods of heterocyclic compound synthesis represents a broad
area of organic chemistry.1 In this context, nitrogen-containing rings are among the most useful
heterocycles and their utility has been widely demonstrated, as a consequence of their exciting biological
properties and their role as pharmacophores of considerable historical importance.2

Macrophages play a crucial role in modulating the initiation and perpetuation of the inflammatory
response. One means by which macrophages modulate inflammation is via their capacity to elaborate
biological mediators, like nitric oxide (NO) and prostaglandins (PGs) which have numerous
cardiovascular and inflammatory effects.3 NO is formed by the enzyme NO synthase (NOS), which exists
as three distinct isoforms.4 The inducible isoform iNOS is expressed after stimulation of cells with a
variety of agents including endotoxin (bacterial lipopolysaccharide, LPS) and cytokines.4,5 The NO
production during inflammatory response may become “self-destructive” owing to its oxidative properties,
as occurs in chronic inflammatory diseases.3,6

Cyclooxygenase (COX) is the first enzyme in the pathway in which arachidonic acid is converted to PGs,
prostacyclin and thromboxane A2 (TXA2).7 COX-2 isoform, whose expression is restricted under basal
conditions, is upregulated by inflammatory stimuli resulting in increased PGE2 production, which has
been suggested to play an important role in the pathophysiology of inflammation and arthritis.8
The co-induction of iNOS and COX-2 in cells stimulated with bacterial endotoxins and other inflammatory stimuli has been described. Since the induction of COX-2 and iNOS results in the increased synthesis of PGs and NO, the selective modulation of NO and PGE\textsubscript{2} overproduction by iNOS and COX-2 might represent an important therapeutical goal in different inflammatory pathologies.

Many compounds described as inhibitors of NOS are nitrogen-containing heterocycles. During the last years we reported the synthesis of substituted heterocycles containing the pyrazolopyrimidine, pyridothienopyrimidine and pyridothieno-1,2,3-triazine skeletons with the aim of finding compounds with antiinflammatory and antihistaminic activity. During a project directed toward the identification of new inhibitors of iNOS and COX-2 induction, we selected for study the isoxazolo[5,4-\textit{d}] and pyrazino[2,3-\textit{d}]pyrimidine nucleus. In a recent paper, we reported that certain isoxazolopyrimidines are potent inhibitors of nitrite and PGE\textsubscript{2} production in endotoxin-stimulated macrophages, which can be related to a reduced expression of iNOS and COX-2 in some cases. These products were also found active on nitrite levels by oral administration, in the mouse air pouch model of inflammation. In this paper we describe the synthesis of a series of these isoxazolo[5,4-\textit{d}]pyrimidine and pyrazino[2,3-\textit{d}]pyrimidine (pteridine) compounds.

![Figure 1 Retrosynthetic pathway for synthesis of the pteridines and isoxazolo[5,4-\textit{d}]pyrimidines](image)

For the preparation of the heterocycles we devised suitable procedure for the introduction of a variety of substituents with a minimum change in the nature of the chemistry used. For the preparation of the title compounds (Figure 1), we used a synthetic procedure based on the use of \(\beta\)-enaminonitriles\textsuperscript{13} and phosgeniminium chloride that allows the introduction of two substituents R and N(CH\textsubscript{3})\textsubscript{2} on the heterocycle.\textsuperscript{14} Thus, substituent dimethylamino is introduced during the formation of the pyrimidine ring. Substituent R is introduced in the last step by means of an aromatic nucleophilic substitution of a chloro-substituent. Several nucleophiles of nitrogen, oxygen and sulfur have been shown effective in this reaction. We considered this methodology would be attractive due to its conciseness and utilization of readily synthesized or commercially available starting materials.

The \textit{N,N}-dichloromethylenedimethyliminium salts, particularly \textit{N,N}-dichloromethylenedimethyl iminium chloride (Viehe’s salt) are very useful reagents that can function as Vilsmeier or Mannich acceptors and
lead to the insertion of a one-carbon unit bearing a dialkylamino group.\textsuperscript{15} This makes them especially useful in one-step heterocyclization reactions such as those considered here.

The construction of fused pyrimidines from ortho-aminonitriles and phosgene iminium salts has been successfully applied to the preparation of many heterocyclic fused systems.\textsuperscript{14} For the synthesis of isoxazolo[5,4-\textit{d}]pyrimidines and pyrazino[2,3-\textit{d}]pyrimidines, we used that strategy starting with \textit{o}-aminocyanoisoxazole (1) and \textit{o}-aminocyanopyrazole (5), respectively. The starting 5-amino-4-cyano-3-methylisoxazole (1)\textsuperscript{16} and 2-amino-3-cyano-5-phenylpyrazine (5)\textsuperscript{17} were readily obtained by previously described procedures.

In this way, 5-amino-4-cyano-3-methylisoxazole (1), was made to react with dichloromethylenedimethyliminium chloride in refluxing 1,2-dichloroethane (Scheme 1) affording the 3-chloroamidine (2), which was reacted with dry hydrogen chloride to undergo cyclization to fused heterocyclic compound 4-chloro-6-dimethylamino-3-methylisoxazolo[5,4-\textit{d}]pyrimidine (3). Aromatic nucleophilic displacement of the chlorine atom in 3 was achieved by reaction with nucleophiles and resulted in the formation of substituted products (4a-k) in good yields (62-98%).

\begin{center}
\textbf{Scheme 1} Synthesis and structure of isoxazolo[5,4-\textit{d}]pyrimidines (3) and (4)
\end{center}

It is known that dichloromethylene iminium salts do not normally react with the cyano group so the formation of isoxazolo[5,4-\textit{d}]pyrimidine (3) from chloroamidine (2) can be assumed to proceed through the corresponding chloroiminium chloride.\textsuperscript{18} One-pot high yield synthesis (80\%) of isoxazolopyrimidine (3) from \textit{\beta}-aminonitrile (1) was carried out by refluxing 1 and phosgene iminium chloride in 1,2-dichloroethane for 1 h followed by treatment with hydrogen chloride.

All the compounds shown in Table 1 gave satisfactory elemental analyses and spectral data (IR, MS, and \textsuperscript{1}H and \textsuperscript{13}C NMR) coherent with the structures proposed. The structure of compounds (2) and (3) were determined from spectral data. The mass spectra showed the expected molecular ion peak and the IR spectrum of 2 exhibited a strong absorption band at $\nu = 1610 \text{ cm}^{-1}$ due to the imino group and presented
the characteristic signal at $\nu = 2220$ cm$^{-1}$ (CN), while the decoupled $^{13}$C NMR spectrum showed one signal at $\delta = 112.2$ due to the carbon atom in the one cyano group. After cyclization, the spectrum of 3 did not include those types of signals. The most salient features of the $^1$H NMR and $^{13}$C NMR spectra are given on Experimental.

$^a$ All spectra data were consistent with the assigned structures.

$^b$ All compounds analyzed for C, H, N; analytical results are within ±0.4% of theoretical values.

$^c$ Recrystallized from ethanol.

$^d$ Purified by medium-pressure column chromatography using dichloromethane:ethyl acetate (1:1, v/v) as eluent.

$^e$ Purified by medium-pressure column chromatography using hexane:ethyl acetate (3:1, v/v) as eluent.

$^f$ Purified by medium-pressure column chromatography using hexane:ethyl acetate (1:1, v/v) as eluent.

$^g$ Purified by medium-pressure column chromatography using dichloromethane as eluent.

Some isoxazolopyrimidine derivatives are potent inhibitors of nitrite and PGE$_2$ production in endotoxin-stimulated macrophages, which can be related to a reduced expression in iNOS and COX-2 in some cases. These products were also active on nitrite levels by oral administration, in the mouse air pouch model of inflammation. This group of compounds may offer new drugs for the modulation of NO production in different inflammatory and NO-related pathologies.

Annelated pyrazines, such as quinoxaline and pteridine derivatives are very important nitrogen-containing heterocycles found in biological systems and widely used as pharmaceuticals. Pyrazino[2,3-d]pyrimidines are known as “pteridines”, because the first examples of the ring system, as natural products, were found in pigments, like xanthopterin (yellow), in the wings of butterflies (Lepidoptera). Folic acid (vitamin B-9), a well-known pteridine derivative, is essential to the body for the formation of new cells; it is a key vitamin in cellular function and repair. Flavines also represent
pteridine derivatives\textsuperscript{22} and are involved in the formation of red blood cells, in respiration, antibody production, in human growth regulation and reproduction. The pteridine ring system has subsequently been found in coenzymes which use tetrahydrofolic acid, the molybdenum cofactor on the oxomolybdoenzymes, and in the anti-cancer drug methotrexate, a classical dihydrofolate reductase inhibitor clinically used in cancer chemotherapy.\textsuperscript{23} Aminopterin and Methotrexate, synthesized as potential antimetabolites of folic acid (Figure 2), induced remissions of acute lymphoblastic leukemia.\textsuperscript{24} The biological basis for the cytotoxicity of these two compounds was found to be their potent inhibitory activity towards dihydrofolate reductase (DHFR), an enzyme which regenerates tetrahydrofolate from dihydrofolate, and therefore maintains a cellular supply of this coenzyme which plays critical roles in a wide spectrum of cellular one-carbon transfer reactions.\textsuperscript{25}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{folic_acid_and_methotrexate.png}
\caption{Figure 2}
\end{figure}

Methotrexate itself, although it has been in clinical use for some 40 years, is a non-selective cytotoxic agent. Its extreme toxicity coupled with its in-effectiveness against many types of human cancers has severely limited its clinical effectiveness.\textsuperscript{25} Extensive efforts over many years have been made to modify the aminopterin/methotrexate/folic acid structure in an effort to develop less toxic cofactor antagonists which possess more selective transport and inhibitory properties and which might therefore be effective against a broader range of human cancers.\textsuperscript{26}

On the other hand, tetrahydrobiopterin derivatives and dihydropteridine derivatives are of great interest for their dihydrofolate reductase inhibiting, mental retardation, neurotransmitter and use in treating other neurological problems.\textsuperscript{27} In addition, methotrexate has been shown to possess immunosuppressive activity, and the establishment of a facile and regioselective construction of these fundamental pteridine heterocyclic skeleton is important.\textsuperscript{28}

The synthesis of the pteridine system has been approached by two obvious routes: one is the fusion of the pyrazine ring onto a preformed 4,5-diaminopyrimidine, and the second, the elaboration of the pyrimidine ring on a preformed pyrazine. The first of these, the Gabriel-Isay condensation, suffers from the disadvantage that condensation of the heterocyclic 1,2-diamine with an unsymmetrical 1,2-dicarbonyl compound usually leads to a mixture of two 5/6-substituted isomers.\textsuperscript{29} Other approaches for the pteridine nucleus from pyrimidine intermediates are the Timmis reaction, which makes use of the regioselective condensations of 6-amino-5-nitrosopyrimidines with aldehydes, ketones, esters, and nitriles under basic
catalysis, and the Polonovski-Boom cyclization, an unambiguous regioselective approach by reacting 6-chloro-5-nitro- and 6-chloro-5-arylazopyrimidines, respectively, with α-aminocarbonyl compounds followed by reduction to the 5-amino derivatives and subsequent cyclization. (6R)- and (6S)-5,6,7,8-tetrahydrofolic acids were prepared by this approach.

Pteridine synthesis from pyrazine precursors is usually applied in such cases where the formation of special derivatives cannot be achieved easily by the pyrimidine approach. It was to avoid this difficulty that the alternative strategy, the Taylor synthesis, now widely used, starting with a pyrazine, was developed. This versatile new approach to pteridines utilizes as its key first (and unequivocal) step the cyclization of an α-oximinocarbonyl compound with an α-aminonitrile to give a 2-amino-3-cyano- (or carbalkoxy-) pyrazine 1-oxide which can then be converted to pteridines and pterins by a series of simple deoxygenation and cyclization steps. Various antileukemic agents related to methotrexate are also synthetically available by the Taylor’s method.

We found that the pteridine nucleus is easily formed by the synthetic procedure based on the use of β-enaminonitriles and phosgeniminium chloride. Thus, the reaction of the 2-amino-3-cyano-5-phenylpyrazine (5) with phosgeniminium chloride gave 6 (Scheme 2). Amide halide intermediate (6) underwent cyclization to the corresponding fused compounds (7) by reaction with dry hydrogen chloride. On treatment with phosgeniminium salt in refluxing 1,2-dichloroethane for 1 h and a subsequent treatment with hydrogen chloride, 5 directly afforded the substituted fused heterocyclic compound (6) which, in turn, showed the remarkable reactivity of its chloro substituent towards nucleophilic agents.

The structures of the new compounds were confirmed by elemental and spectroscopic features and also are summarized on Experimental.

Reagents and Conditions: i) [Cl₂CNMe₂]+Cl⁻, 1,2-dichloroethane, reflux; ii) HCl(g), 1,2-dichloroethane, rt; iii) amine in THF, reflux.

Scheme 2 Synthesis and structure of pteridines (8a-c)
Although several methods are available for the synthesis of pteridines, in this simplicity, the affordability of the starting materials, good yields obtained and, straightforward product isolation, the proposed one-pot procedure compares favorably with other synthesis for the pyrazino[2,3-d]pyrimidine (pteridine) system. This approach has the further advantage that because the 2-amino-3-cyano-5-substituted pyrazine is presynthesized, it eventually produces, regioselectively, 6-substituted pteridines and substitution at the 6-position is the common pattern in natural pteridines.

**EXPERIMENTAL**

Melting points were determined on a Bibby SMP3 apparatus and are uncorrected. All reagents used were commercial grade chemicals from freshly opened containers. IR spectra were recorded as potassium bromide disks on a Bruker vector 22FT-IR. $^1$H and $^{13}$C NMR spectra were obtained on a Bruker AC 200F instrument at room temperature. MS were obtained on a VG-QUATTRO spectrometer. The Silica gel 60F-254 used for analytical thin layer chromatography was purchased from Merck. Microanalyses for C, H, N, and S were performed by the elemental analyses general services of the University of A Coruña.

5-Chlorodimethylaminomethylamino-4-cyano-3-methylisoxazole (2).

A solution of 1$^6$ (1.23 g, 10 mmol) and dichloromethylene-dimethyliminium chloride (2 g, 12 mmol) in 1,2-dichloroethane (30 mL) was heated at reflux until all starting material has disappeared as checked by TLC (1 h). The solvent was removed under reduced pressure and the resulting solid was purified by flash chromatography using hexane/dichloromethane (1:1, v/v) as eluent to obtain 2 (2.01 g, 95%); mp 78–80 ºC (EtOH). IR (KBr, cm$^{-1}$): $\nu = 2220$ (CN), 1630 cm$^{-1}$. MS (EI, m/z %) = 214 ($M^+ + 2$, 16), 212 ($M^+$, 47), 107 (100). $^1$H NMR (CDCl$_3$): $\delta = 2.23$ (s, 3 H, CH$_3$); 3.23 (s, 6H, NMe$_2$). $^{13}$C NMR (CDCl$_3$): $\delta = 10.8$ (CH$_3$); 40.5 (NMe$_2$); 79 (C-4); 112.2 (CN). Anal. Calcd for C$_8$H$_9$N$_4$OCl: C, 45.19; H, 4.27; Cl, 16.67; N, 26.35. Found: C, 45.32; H, 4.22; Cl, 16.54; N, 26.52.

4-Chloro-6-dimethylamino-3-methylisoxazolo[5,4-d]pyrimidine (3).

Method A:

A mixture of 1 (0.617 g, 5 mmol) and dichloromethylene-dimethyliminium chloride (1 g, 6 mmol) in 1,2-dichloroethane (30 mL) was heated at reflux for 1h. A stream of dry hydrogen chloride was passed through the mixture for 3 h and the reaction mixture was allowed to stand 24 h at rt. The solvent was then removed under reduced pressure and the resulting solid was recrystallized from EtOH to afford 3 (0.85 g, 80%); mp 146-148 ºC. IR (KBr, cm$^{-1}$) $\nu = 2940$, 1630. MS (EI, m/z %) = 214 ($M^+ + 2$, 2), 212 ($M^+$, 5), 57 (100). $^1$H NMR (CDCl$_3$) $\delta = 2.53$ (s, 3H, CH$_3$); 3.25 (d, 6H, NMe$_2$). $^{13}$C NMR (CDCl$_3$): $\delta = 11.2$ (CH$_3$); 36.7 (NMe$_2$); 100 (C-3a); 153.8, 154.5, 161.1, 175.7 (C-3, C-4, C-6, C-7a). Anal.
Caled for C_{13}H_{19}N_{5}O: C, 45.19; H, 4.27; Cl, 16.67; N, 26.35. Found: C, 45.26; H, 4.16; Cl, 16.78; N, 26.29.

Method B

A stream of dry hydrogen chloride was passed through a mixture of 2 (1.06 g, 5 mmol) in 1,2-dichloroethane (25 mL) for 3 h. The reaction mixture was allowed to stand overnight at rt. The solvent was then removed under reduced pressure and the resulting solid was recrystallized from EtOH to afford 3 (0.78 g, 74%).

4-Substituted 6-dimethylamino-3-methylisoxazolo[5,4-d]pyrimidines (4a-i). General Procedure:

A solution of 3 (106 mg, 0.5 mmol) and the appropriate amine (0.56 mmol) in THF (5 mL) was heated at reflux until all starting material had disappeared as checked by TLC. The solvent was then removed under reduced pressure and the resulting solid was recrystallized from EtOH or purified by flash chromatography.

6-Dimethylamino-3-methyl-4-piperidinoisoxazolo[5,4-d]pyrimidine (4a) (70%): mp 89-90 °C (EtOH). IR (KBr, cm⁻¹) ν = 2980, 1620. MS (EI, m/z %) = 261 (M⁺, 82), 232 (42), 84 (100). ¹H NMR (CDCl₃) δ = 1.64 (m, 6H, CH₂); 2.41 (s, 3H, CH₃); 5.87 (s, 2H, OCH₂); 6.68 (s, 2H, CH₃); 8.20 (s, 6H, NMe₂). ¹³C NMR (CDCl₃): δ = 14.7 (CH₃); 24.3, 25.5 (CH₂); 36.9 (NMe₂); 48.7 (NCH₂); 89.2 (C-3a); 152.7, 160.2, 161.2, 178.7 (C-3, C-4, C-6, C-7a). Anal. Caled for C_{13}H_{19}N_{5}O: C, 59.75; H, 7.33; N, 26.80. Found: C, 59.92; H, 7.06; N, 26.98.

6-Dimethylamino-3-methyl-4-(3,4-methylenedioxybenzylpiperazino)isoxazolo[5,4-d]pyrimidine (4b) (99%): mp 148-50 °C (EtOH). IR (KBr, cm⁻¹) ν = 2980, 1620. MS (EI, m/z %) = 396 (M⁺, 8), 206 (57), 135 (100). ¹H NMR (CDCl₃) δ = 2.37 (s, 3H, CH₃); 2.45-250 (m, 4H, NCH₂); 3.11 (s, 6H, NMe₂); 3.39 (s, 2H, CH₂); 3.60-3.65 (m, 4H, NCH₂); 5.87 (s, 2H, OCH₂); 6.68 (s, 2H, C₆H₅CH₂O₂); 6.81 (s, 1H, C₆H₅CH₂O₂). ¹³C NMR (CDCl₃): δ = 14.9 (CH₃); 36.9 (NMe₂); 47.5, 52.3 (NCH₂); 62.3 (CH₂); 89.2 (C-3a); 100.6 (OCH₂); 107.6, 109.0 (C-2', C-5'); 122.0 (C-6'); 131.3 (C-1'); 146.4, 147.4 (C-3', C-4'); 152.4, 160.0, 161.0 (C-3, C-4, C-6, C-7a). Anal. Caled for C_{19}H_{24}N_{6}O₃: C, 60.59; H, 6.10; N, 21.20. Found: C, 60.75; H, 5.76; N, 21.34.

4-Benzylamino-6-dimethylamino-3-methylisoxazolo[5,4-d]pyrimidine (4c) (79%): mp 170-172 °C (EtOH). IR (KBr, cm⁻¹) ν = 3380 (NH), 2880, 1640. MS (EI, m/z %) = 283 (M⁺, 53), 206 (28), 91 (100). ¹H NMR (CDCl₃) δ = 2.45 (s, 3H, CH₃); 3.20 (s, 6H, NMe₂); 4.79 (d, 2H, J = 5.86 Hz, CH₂); 5.29 (br t, 1H, NH); 7.36 (m, 5H, C₆H₅). ¹³C NMR (CDCl₃): δ = 12.5 (CH₃); 37.3 (NMe₂); 44.6 (CH₂); 88.0 (C-3a); 127.4, 127.5, 128.2, 128.6, 138.6 (C₆H₅); 152.8 157.5, 162.7, 178.0 (C-3, C-4, C-6, C-7a). 4-Diethylamino-6-dimethylamino-3-methylisoxazo[5,4-d]pyrimidine (4h) (84%): mp 100-102 °C (EtOH). IR (KBr, cm$^{-1}$) ν = 2960, 1580, 1400. MS (EI, m/z %) = 249 (M$^+$, 55), 220 (63), 206 (75), 72 (100). $^1$H NMR (CDCl$_3$) δ = 1.27 (t, 6H, J = 7.1 Hz, 2CH$_3$); 2.54 (s, 3H, CH$_3$); 3.20 (s, 6H, NMe$_2$); 3.66 (q, 4H, J = 7.1 Hz, 2CH$_2$). $^{13}$C NMR (CDCl$_3$): δ = 13.3 (CH$_3$); 15.6 (CH$_3$); 37.0 (NMe$_2$); 43.5 (NCH$_2$); 87.9 (C-3a); 152.5, 157.1, 158.8, (C-3, C-4, C-6, C-7a). Anal. Calcd for C$_{12}$H$_{19}$N$_2$O: C, 57.81; H, 7.68; N, 28.09. Found: C, 58.02; H, 7.50; N, 28.28.

6-Dimethylamino-3-methyl-4-n-propylaminoisoxazo[5,4-d]pyrimidine (4i) (85%): mp 120-122 °C (EtOH). IR (KBr, cm$^{-1}$) ν = 3380 (NH); 2980, 1640. MS (EI, m/z %) = 235 (M$^+$, 46), 178 (47), 107 (62), 69 (100). $^1$H NMR (CDCl$_3$) δ = 0.87 (t, 3H, J = 7.3 Hz, CH$_3$); 1.58 (m, 2H, CH$_2$); 2.36 (s, 3H, CH$_3$); 3.09 (s, 6H, NMe$_2$); 3.36-3.46 (m, 2H, CH$_2$); 5.22 (t, 1H, J = 5.6 Hz, NH). $^{13}$C NMR (CDCl$_3$): δ = 11.4 (CH$_3$);
12.3 (CH$_3$); 22.6 (CH$_2$); 37.1 (NMe$_2$); 42.5 (NCH$_2$); 87.8 (C-3a); 153.1, 157.7, 162.7, 177.8 (C-3, C-4, C-6, C-7a). Anal. Calcd for C$_{13}$H$_5$N$_2$O: C, 56.15; H, 7.28; N, 29.77. Found: C, 55.98; H, 7.44; N, 29.66. 6-Dimethylamino-4-methoxy-3-methylisoxazolo[5,4-$d$]pyrimidine (4j)

A solution of 3 (106 mg, 0.5 mmol) and sodium methoxide (33 mg, 0.7 mmol) in MeOH (5 mL) was heated at reflux until all starting material has disappeared as checked by TLC (1.5 h). The solvent was then removed at reduced pressure and the resulting solid was recrystallized from ethanol to afford 4j (67 mg, 68%): mp 116-118 °C. IR (KBr, cm$^{-1}$) $\nu$ = 2940, 1630. MS (EI, m/z %) = 208 (M$^+$, 100), 179 (78).

$^1$H NMR (CDCl$_3$) $\delta$ = 2.45 (s, 3H, CH$_3$); 3.24 (s, 6H, NMe$_2$); 4.04 (s, 3H, OCH$_3$). $^{13}$C NMR (CDCl$_3$): $\delta$ = 11.9 (CH$_3$); 37.4 (NMe$_2$); 53.7 (OCH$_3$); 90.0 (C-3a); 154.3, 162.5, 165.0 (C-3, C-4, C-6, C-7a). Anal. Calcd for C$_9$H$_12$N$_2$O$_2$: C, 51.92; H, 5.81; N, 26.91. Found: C, 52.12; H, 5.66; N, 27.04.

6-Dimethylamino-3-methylisoxazolo[5,4-$d$]pyrimidine-4(5H)-thione (4k)

NaSHxH$_2$O (0.20 g) was added in portions to a solution of 3 (106 mg, 0.5 mmol) in EtOH (10 mL). The reaction mixture was stirred at rt until all starting material has disappeared as checked by TLC. The solvent was removed at reduced pressure and water (10 mL) was added. The solution was neutralized with 2N HCl and the precipitate was filtered off and purified by MPLC using dichloromethane as eluent to obtain 4k (75 mg, 75%): mp 196-198 °C. IR (KBr, cm$^{-1}$) $\nu$ = 3180 (SH), 1580, 1300. MS (EI, m/z %) = 210 (M$^+$, 100), 195 (34), 166 (33), 69 (61). $^1$H NMR (CDCl$_3$) $\delta$ = 2.62 (s, 3H, CH$_3$); 3.28 (s, 6H, NMe$_2$).

$^{13}$C NMR (CDCl$_3$): $\delta$ = 12.4 (CH$_3$); 37.9 (NMe$_2$); 105.2 (C-3a); 135.5, 159.3, 179.7 (C-3, C-4, C-6, C-7a). Anal. Calcd for C$_9$H$_{10}$N$_4$OS: C, 45.70; H, 4.79; N, 26.65; S, 15.25. Found: C, 45.58; H, 4.94; N, 26.83; S, 15.13.

3-Cyano-2-chlorodimethylaminomethylamino-5-phenylpyrazine (6).

A solution of 2-amino-3-cyano-5-phenylpyrazine 5 (0.60 g, 3 mmol) and phosgeninium chloride (0.56 g, 3.5 mmol) in 1,2-dichloroethane (15 mL) was heated at reflux until all starting material has disappeared as checked by TLC (1.5 h). The solvent was removed under reduced pressure and the resulting solid was purified by flash chromatography using dichloromethane as eluent to obtain 6 (0.80 g, 92%); mp 116-118 °C. IR (KBr, cm$^{-1}$): $\nu$ = 2220 (CN), 1640 cm$^{-1}$. MS (EI, m/z %) = 287 (M$^+$ + 2, 9), 285 (M$^+$, 27), 76 (100). $^1$H NMR (CDCl$_3$): $\delta$ = 3.25 (s, 6H, NMe$_2$); 7.41-7.95 (m, 5H, C$_6$H$_5$); 8.87 (s, 1H, H-6).

$^{13}$C NMR (CDCl$_3$): $\delta$ = 40.2 (NMe$_2$); 115.6 (CN); 123.2, 126.1, 128.7, 134.4 (C$_6$H$_5$); 142.5, 146.6, 156.1, (C-2, C-5, C-6). Anal. Calcd for C$_{14}$H$_{12}$N$_2$Cl: C, 58.85; H, 4.23; Cl, 12.41; N, 24.51. Found: C, 58.72; H, 4.02; Cl, 12.61; N, 24.52.

4- Chloro-2-dimethylamino-6-phenylpteridine (7)

Method A

A mixture of 5 (0.60 g, 3 mmol) and phosgeninium chloride (0.56 g, 3.5 mmol) in 1,2-dichloroethane (15 mL) was heated at reflux until all starting material has disappeared as checked by TLC (1.5h). A
stream of dry hydrogen chloride was passed through the mixture for 2 h and the reaction mixture was allowed to stand 72 h at rt. The solvent was then removed under reduced pressure and the resulting solid was purified by flash chromatography using dichloromethane as eluent to afford 7 (0.65 g, 75%); mp 278-280 °C (EtOH). IR (KBr, cm⁻¹) ν = 2920, 1600. MS (EI, m/z %) = 287 (M⁺ + 2, 34), 285 (M⁺, 94), 256 (100). ¹H NMR (CDCl₃) δ = 3.35 (s, 6H, NMe₂); 7.45-7.52 (m, 3H, C₆H₃); 8.10-8.13 (m, 2H, C₆H₃); 9.31 (s, 1H, H-7). ¹³C NMR (CDCl₃): δ = 37.7 (NMe₂); 126.8, 129.1, 130.0, 135.5 (C₆H₃); 150.1 (C-7); 148.2, 155.6, 159.2, 164.2 (C-2, C-4, C-4a, C-6, C-8a). Anal. Calcd for C₁₄H₁₂ClN₃: C, 58.96; H, 4.16; Cl, 12.60; N, 24.29.

Method B

A stream of dry hydrogen chloride was passed through a mixture of 6 (0.285 g, 1 mmol) in 1,2-dichloroethane (15 mL) for 2 h. The reaction mixture was allowed to stand 72 h at rt. The solvent was then removed under reduced pressure and the resulting solid was purified by flash chromatography using dichloromethane /AcOEt (95:5, v/v) as eluent to yield 7 (0.237 g, 82%).

4- Substituted 2-dimethylamino-6-phenylpteridines (8a-c). General Procedure:

A solution of 7 (143 mg, 0.5 mmol) and the appropriate amine (0.7 mmol) in THF (5 mL) was heated at reflux until all starting material had disappeared as checked by TLC. The solvent was then removed under reduced pressure and the resulting solid was purified by flash chromatography using CH₂Cl₂/AcOEt (4:1, v/v) as eluent.

2-Dimethylamino-6-phenyl-4-piperidinopteridine (8a) (85%): mp 288-290 °C (EtOH). IR (KBr, cm⁻¹) ν = 2980, 1580. MS (EI, m/z %) = 334 (M⁺, 100), 319 (67), 128 (75). ¹H NMR (CDCl₃) δ = 1.75 (m, 6H, CH₂); 3.25 (s, 6H, NMe₂); 4.29 (m, 4H, NCH₂); 7.32-7.48, 7.90-7.96 (m, 5H, C₆H₃); 9.07 (s, 1H, H-7). ¹³C NMR (CDCl₃): δ = 24.7, 26.2 (CH₂); 37.1 (NMe₂); 48.9 (NCH₂); 125.7, 128.6, 128.8, 136.6 (C₆H₃); 145.9 (C-7); 142.4, 156.7, 159.4, 160.2 (C-2, C-4, C-4a, C-6, C-8a). Anal. Calcd for C₁₀H₁₂N₆: C, 68.24; H, 6.63; N, 25.13. Found: C, 68.40; H, 6.54; N, 25.06.

2-Dimethylamino-6-phenyl-4-(3,4-methylenedioxybenzylpiperazino)pteridine (8b) (73%): mp 270-272 °C (EtOH). IR (KBr, cm⁻¹) ν = 2980, 1580. MS (EI, m/z %) = 469 (M⁺, 100), 319 (67), 128 (75). ¹H NMR (CDCl₃) δ = 2.47-2.64 (m, 4H, NCH₂); 3.26 (s, 6H, NMe₂); 3.46 (s, 2H, CH₂); 4.08-4.45 (m, 4H, NCH₂); 5.96 (s, 2H, OCH₂); 6.75-6.89 (m, 3H, C₆H₃CH₂O₂); 7.41-7.93 (m, 5H, C₆H₃); 9.09 (s, 1H, H-7). ¹³C NMR (CDCl₃): δ = 37.2 (NMe₂); 47.3 (NCH₂); 53.0 (NCH₃); 62.5 (CH₂); 100.8 (OCH₂); 107.7, 109.3, (C-2’, C-5’); 122.1 (C-6’); 123.9, 125.8, 128.9, 136.4 (C₆H₃); 131.5 (C-1’); 146.3 (C-7); 146.6, 147.6 (C-3’, C-4’); 142.7, 156.7, 159.3, 160.0 (C-2, C-4, C-4a, C-6, C-8a). Anal. Calcd for C₂₁H₂₁N₅O₂: C, 66.51; H, 5.80; N, 20.88. Found: C, 66.33; H, 5.92; N, 21.00.

4- Benzylamino-2-dimethylamino-6-phenylpteridine (8c) (90%): mp 160-162 °C (EtOH). IR (KBr, cm⁻¹) ν = 3340 (NH), 2980, 1640. MS (EI, m/z %) = 356 (M⁺, 25), 91 (100). ¹H NMR (CDCl₃) δ = 3.27 (s, 6H,
NMe₂); 4.80 (d, 2H, J = 6.3 Hz, CH₂); 5.42 (br t, 1H, NH); 7.26-7.95 (m, 10H, C₆H₅); 9.10 (s, 1H, H-7). ¹³C NMR (CDCl₃): δ = 37.0 (NMe₂); 44.3 (CH₂); 121.3 (C-4a); 127.1, 127.4, 128.3, 128.6, 135.8, 138.1 (C₆H₅); 145.7 (C-7); 144.0, 154.7, 159.4, 160.6 (C-2, C-4, C-6, C-8a). Anal. Calcd for C₂₁H₂₀N₆: C, 70.77; H, 5.66; N, 23.58. Found: C, 70.65; H, 5.78; N, 23.57.
