Abstract — The reactions of 3-(bromoacetyl)tropolone (1) with benzenethiol (2a) and heteroaromatics (2b-4) gave 3-[(phenylthio)acetyl]tropolone (3a) and 3-[(heteroarylthio)acetyl]tropolones (3b-4), respectively. These compounds (3a-4) reacted with hydrazine hydrate and methylhydrazine to afford 3-phenylthiomethyl- (4a) and 3-heteroaryltolmethyl-1H,8H-cyclohepta[d]pyrazol-8-ones (4b-4) and their corresponding 1-methyl substituted compounds (3b-4), respectively.

For many years, we have engaged in the synthesis of heterocycle-fused tronopoids from 3-acetyl tropolone. Recently, gastric antisecretory effect has been found in 2-(heteroarylthiol)imidazo[1,5-a]pyridazines and their S-oxides, which have the five-membered diazaheterocycle-fused tropoid structure. On the other hand, their partial structure is very similar to that of omeprazole, 5-methoxy-2-{(4-methoxy-3,5-dimethyl-2-pyridyl)methyl[sulfanyl]-1H-benimidazole, which is undergoing the clinical trial as an anti-ulcer agent. In order to obtain biologically more active heterocycle-fused non-benzenoid aromatic compounds, we introduced heteroaryltolmethyl group into the 3-position of 1H,8H-cyclohepta[d]pyrazol-8-one. This paper deals with these results.

It is well-known that treatment of α-halo ketones with thiols gives α-alkylthio or α-aryltio ketones. A mixture of 3-(bromoacetyl) tropolone (1) and benzenethiol (2a) in absolute ethanol was refluxed for 30 min to give 3-[(phenylthio)acetyl]tropolone (3a) in 48% yield. Heteroarenenethiols (2b-4) also reacted...
with the α-bromoketone (1) to afford the corresponding 3-[(heteroarlyithio)acetyl]tropolones (3b-f) in 51-87% yields. Heating of these compounds (3a-f) with hydrazine hydrate for 1 h in methanol gave 3-phenylthio-methyl- (4a) and 3-heteroarylthiomethyl-1H,8H-cyclohepta[d]pyrazol-8-ones (4b-f) in 21-76% yields. In a similar manner, the reaction of the compounds (3b-f) with methylhydrazine gave 3-heteroarylthiomethyl-1-methyl derivatives (5b-f) in 20-32% yields. The procedure in this work provides a simple and convenient method for the preparation of a series of biologically active 3-heteroarylthiomethyl substituted 1H,8H-cyclohepta[d]pyrazol-8-ones.

EXPERIMENTAL

The melting points were determined with a Yanagimoto MP-S2 apparatus and are uncorrected. The ir spectra were taken on a JASCO A-102 spectrophotometer. The 1H nmr spectra were recorded with a JEOL JNM-PMX60S1 spectrometer (60 MHz). The mass spectra were measured on a JEOL JMX-DX303HF spectrometer.

3-[(Phenylthio)acetyl]- (3a) and 3-[(Heteroarlyithio)acetyl]tropolones (3b-f): General Procedure:

A solution of 3-(bromoacetyl)tropolone (1) (1.22 g, 5.0 mmol) and benzenethiol (2a) or heteroarenethiol (2b-f) (5.0 mmol) in absolute ethanol (40 ml) was refluxed for 30 min. After cooling, the precipitates were collected and recrystallized from ethanol to give 3a or 3b-f.
