Abstract—A synthesis of 3,4-disubstituted 2-carbethoxy-5-methylpyrroles from alkenes via isoxazoles is described.

As the precursor for the synthesis of symmetrical octasubstituted porphyrins¹ we have investigated the production of pyrrole derivatives which have identical substituents in the 3 and 4 positions. We describe here a pyrrole synthesis in which the basic strategy is to utilize the symmetry of a disubstituted alkene for the generation of a pyrrole with the general structure 1.²

The synthesis begins with a 1,3-dipolar addition of acetonitrile oxide (generated in situ by the nitroalkane dehydration method)³ to 1,5-cyclooctadiene. The alkene is used in large excess to ensure production of the mono-adduct. After the syn-diphenylurea and excess 1,5-cyclooctadiene

Reagents: (i) EtNO₂, Et₃N, Ph-NCO; (ii) MnO₂, benzene; (iii) mCPBA, CHCl₃; (iv) H₅IO₆, H₂O pH 7.1; (v) Ph₃P=CHCO₂Et, THF; (vi) H₂, 5% Rh-C, 1:1 EtOH-Et₃N; (vii) (EtO₂C)₂C=NOH (7), Zn, HOAc

were removed, isoxazoline 2 was obtained in 74% yield⁴ after distillation, based on the amount of nitroethane employed. Dehydrogenation of 2 using activated γ -MnO₂ in benzene with azeotropic removal of water⁵ gave the unsaturated isoxazole 3 in 89% yield after distillation. The isolated double bond in 3 was cleaved by first making the epoxide (1.1 equiv. *m*-chloroperoxybenzoic acid, CHCl₃, 0°C; 96%) followed by periodate cleavage⁶ to the dialdehyde 4 (1.05 equiv. H₅IO₆, H₂O, pH 7.1, 85°C, 20 min.; 96%) which was used in the next step without further purification. Wittig

olefination of **4** using carbethoxymethylenetriphenylphosphorane (2.2 equiv., THF, 25°C, 12 h) produced the bis-unsaturated ester **5** in 97% yield after purification by column chromatography (SiO₂, ethyl acetate). Hydrogenolysis of the isoxazole ring⁷ (5% Ph-C, 1:1 ethanol/triethylamine, 4 atm H₂, 30 h) was accompanied by hydrogenation of the unsaturated ester side-chains, giving enaminone **6** in nearly quantitative yield. The synthesis was completed by reductive condensation of diethyl 2-oximinomalonate (**7**) with **6** (1.4 equiv. **7**, excess Zn dust, acetic acid, reflux, 2 h) to give pyrrole **8** in 80% yield after column chromatographic purification (SiO₂, ether).⁸ Thus, preparation of **8** was achieved in 63% overall yield from isoxazoline **2**, the latter being available in multi-gram quantities.
