Abstract - Two different synthetic strategies have been elaborated for the synthesis of 2-[(2-hydroxyethoxy)methyl] thiazole-4-carboxamide (4) and 2-[[2-hydroxy-1-(hydroxy-methyl)ethoxy]methyl] thiazole-4-carboxamide (5).

Among the synthetic C-nucleosides tiazofurin (1) and selenazofurin (2) (see Table 1) have received more attention in the past few years due to their antitumor and antiviral activities\(^2\). Mao and Marquez have reported on the synthesis of 3, the first acyclic analogue of tiazofurin\(^3\), therefore it seemed interesting to prepare another types of acyclic tiazofurin analogues. This intention is also motivated, not least, by the continuous success of acyclic nucleosides in the field of antiviral chemotherapy. A number of acyclonucleosides and also some acyclic C-nucleosides have been synthesized and evaluated for their antiviral potency\(^4\).

We are pleased to report herein on the synthesis of 4 and 5, two new acyclic analogues of tiazofurin. During the preparation of this manuscript appeared the review of Chu and Cutler\(^4e\).

on acyclonucleoside analogues and this paper cited the personal communication of Baker and Kumar who have prepared 4 and 5, and, in addition, 6 and 7 as well. Our paper presents a different way for the preparation of 4 and 5 with full experimental details.

For the acyclic chain we chose the suitably benzylated alcohols 8 and 9 (see Scheme 1). The alcohols were reacted with methyl bromoacetate in anhydrous dioxane in the presence of sodium hydride to yield the esters 10 and 11.

\[ \text{SCHEME 1} \]

\[ \begin{array}{cccccc}
\text{8, 9} & \xrightarrow{\text{OH}} & \text{BnO} & \xrightarrow{\text{CH}_2\text{CO}_2\text{Me}} & \text{BnO} & \xrightarrow{\text{NH}_2} \\
8, 10 & \xrightarrow{\text{BnO}} & 11, 12 & \xrightarrow{\text{CO}_2\text{Et}} & 14, 15 \\
\end{array} \]

The esters were smoothly transformed into the corresponding amides 12 and 13 with methanolic ammonia. The amides 12 and 13 were subjected to thiation with the aid of Lawesson's reagent, on a greater scale, with tetraphosphorus decasulphide in refluxing dioxane. Compound 15 was allowed to react with ethyl bromopyruvate in cold acetonitrile solution according to Srivastava.

An intermediate, too unstable to be completely characterized, was isolated, which, presumably, was a hydroxythiazoline derivative (20) as it could be judged on the basis of the behaviour of partially decomposed product. Namely, this intermediate did not contain the heteroaromatic thiazole ring (absence of absorption up to 8 ppm in the pmr spectrum and in the region of ca. 3100 cm\(^{-1}\) in the infrared spectrum - both being characteristic to the C(5)-H- moiety of a 2,4-disubstituted thiazole ring\(^\text{10b, 10c}\) and it could readily be transformed to the stable thiazole 17 upon heating either in the presence or absence of an acid\(^\text{10a}\) (see Scheme 2). No more attempts have been made to identify this compound and the Hantzsch reaction of 14 and 15 were carried out in refluxing ethanol to afford the thiazoles 16 and 17. It is interesting to note that in the tiazofurin
synthesis of Srivastava et al., utilizing a similar strategy, no intermediate could be detected during the condensation reaction of the corresponding thioamide with ethyl bromopyruvate in cold acetonitrile solution.

The ethoxycarbonyl function of compounds 16 and 17 was transformed into a carboxamide group in a sluggish reaction with methanolic ammonia to give 18 and 19, respectively.

The removal of benzyl protecting groups was successful neither via catalytic hydrogenation over palladium on charcoal nor with transfer hydrogenation in the presence of cyclohexene and palladium on charcoal. Therefore we attempted the deprotection with boron trifluoride etherate/ethanethiol system but the reaction mixture was too complex and the yield was poor (10%). Our experiments were more fruitful with the classical boron tribromide/dichloromethane system, although this reagent was not often employed in the cleavage of benzyl ethers.

In order to shorten and simplify the above reaction sequence we envisaged (a) a more direct preparation of the key thioamides, and (b) a different way of manipulating the protecting groups in order to avoid the laborious ion exchange chromatography. Our synthetic pathway is outlined in Schemes 3 and 4.

\[ \text{SCHEME 3} \]

1: liq. \( \text{H}_2\text{S}, 4\)-dimethylaminopyridine, r.t.; ii: \( \text{BrCH}_2\text{COCO}_2\text{Et/EtOH, } \Delta \); iii: \( \text{NH}_3/\text{MeOH, r.t.} \)
In the case of 4 we have started from the nitrile 22 prepared from 2-benzoyloxyethanol\textsuperscript{15} (21) according to Babin et al.\textsuperscript{16} Compound 22 was converted into thioamide 23 with liquid hydrogen sulphide in the presence of catalytic 4-dimethylaminopyridine\textsuperscript{9}. In agreement with our previous experiments, the Hantzsch synthesis with ethyl bromopyruvate was performed in refluxing ethanol in lieu of cold acetonitrile to give the thiazole 24. Treatment of 24 with methanolic ammonia afforded 4 in a high yield.

For the synthesis of 5 we needed the nitrile 25. In a similar fashion as 22 was prepared from the corresponding alcohol, we treated 2 with paraformaldehyde and dry hydrogen chloride. The crude chloromethyl compound was allowed to react without isolation with potassium cyanide under phase transfer conditions. The nitrile 25 was obtained in 54% yield but we were unable to remove a small impurity by chromatographic means and therefore we attempted a direct Williamson-type synthesis of this compound. Thus, excess chloroacetonitrile and sodium iodide were added to the alcoholate of 2. The nitrile, although pure, was obtained in poor yield (33%), therefore we utilized the previous way of obtaining this substance. Compound 25, stable at room temperature for 1-2 months, was treated with liquid hydrogen sulphide in the presence of 4-dimethylaminopyridine\textsuperscript{9}. Unfortunately, a considerable amount of the starting material was recovered and the yield of the thioamide 15 was low (35%).

The treatment of 15 with ethyl bromopyruvate in boiling alcohol afforded the thiazole, which, without isolation, was subjected to acetylation with the aid of acetic anhydride and boron trifluoride etherate\textsuperscript{17}. Then the acetyl derivative 26 was ammonolysed and 5 was obtained in good yield.

The new compounds were characterized by means of spectroscopic methods and elemental analyses. In the case of thiazole derivatives in the mass spectra a fragmentation pattern, characteristic to this class of compounds\textsuperscript{18}, could be observed (Scheme 5).
The ion 27 appeared with low intensity, or, sometimes, it could not be detected but the peaks of 28 and 29 or those of 30 and 31 could readily be identified in the spectra.

In the carbon-13 spectra of 4 and 5 a surprising difference in the heteroaromatic moiety could be observed relative to the parent nucleosides 2-α-D-arabinofuranosylthiazole-4-carboxamide (32) and 2-α-D-arabinofuranosylthiazole-4-carboxamide (33)19 (see Table 2). While the carbonyl group showed nearly the same chemical shift in 4 and 5 as in 2 and 33, the carbons C-2, C-4 and C-5 showed a downfield shift relative to those observed for 2 and 33. Our assignments of the thiazole ring were corroborated by long range INEPT experiments20 and 1H coupled 13C spectra obtained in the gated decoupling mode, and, not least, by comparing the corresponding data with those of tiazofurin (1), the spectrum of which was obtained using the same technique (To the best of our knowledge the 13C nmr spectrum of tiazofurin has not been reported until now). The chemical shifts for the thiazole portion in 1 were practically the same as in 4 and 5. The chemical shift of C-2, as expected, is the most sensitive to the replacement of sugar moiety with an acyclic side chain. At this moment we are unable to convincingly explain these striking differences of the chemical shifts in the heterocyclic moieties of compounds 1, 4, 5 and 32, 33, respectively:

The biological activities of 4 and 5 will be reported elsewhere.

<sup>a</sup>For numbering policies see Table 1. <sup>b</sup>Ref. 19. <sup>c</sup>Solvent : D<sub>2</sub>O. <sup>d</sup>Solvent : DMSO-d<sub>6</sub>. <sup>e</sup>The C-3' assignment of 1 is based on a long range INEPT experiment<sup>20</sup>. The C-5' was assigned according to its multiplicity observed in the <sup>1</sup>H coupled spectrum. All other assignments (C-1', C-2', C-4') are tentative but in accordance with the data described for n-D-riburansyl C-nucleosides<sup>21</sup>. <sup>f</sup>Assignments in the side chain are based on spin echo experiments and on analogues with the chemical shifts of other acyclonucleosides<sup>22</sup>.

### EXPERIMENTAL

Melting points were determined in open capillary tubes or on a Kofler electric hot stage and are not corrected. The dried (magnesium sulphate) solutions were concentrated in a rotary vacuum evaporator, usually below 40 °C.

The uv spectra were taken on a Unicam SP 800 spectrophotometer. The ir spectra were recorded on a Perkin-Elmer 283 B spectrometer in potassium bromide pellets unless otherwise stated.

Nmr spectra were obtained with a Bruker WP 200 SY instrument in CDCl<sub>3</sub> or DMSO-d<sub>6</sub> solutions with TMS as internal standard (δ, ppm). Tlc : Kieselgel 60 F 254, Merck. The chromatograms were rendered visible under uv lamp, spraying with alcoholic sulphuric acid and heating on an electric hot plate, or, in the case of thioamides, spraying with alcoholic iodine azide<sup>23</sup>. Flash chromatography was performed on silica gel. Eluents were used as follows : light petroleum - acetone 95 : 5 (E1); 9 : 1 (E2); 85 : 15 (E3); 8 : 2 (E4); 7 : 3 (E5); 6 : 4 (E6); chloroform - methanol 19 : 1 (E7); 9 : 1 (E8); 8 : 2 (E9); light petroleum -ethyl acetate 95 : 5 (E10); 8 : 2 (E11); 7 : 3 (E12); 6 : 4 (E13); hexane - ethyl acetate 1 : 1 (E14). For ion exchange chromatography Amberlite IRA 400 (OH<sup>-</sup>) ion exchanger was employed. Elemental analyses were performed by the Microanalytical Division of our Institute.

---

<sup>20</sup>Flash chromatography was performed on silica gel. Eluents were used as follows : light petroleum - acetone 95 : 5 (E1); 9 : 1 (E2); 85 : 15 (E3); 8 : 2 (E4); 7 : 3 (E5); 6 : 4 (E6); chloroform - methanol 19 : 1 (E7); 9 : 1 (E8); 8 : 2 (E9); light petroleum -ethyl acetate 95 : 5 (E10); 8 : 2 (E11); 7 : 3 (E12); 6 : 4 (E13); hexane - ethyl acetate 1 : 1 (E14). For ion exchange chromatography Amberlite IRA 400 (OH<sup>-</sup>) ion exchanger was employed. Elemental analyses were performed by the Microanalytical Division of our Institute.
Methyl 2-Benzylxoyethoxyacetate (10). 2-Benzylxoyethanol (8) (4.62 g, 30 mmoles) was allowed to react with sodium hydride (1.44 g, 60 mmoles) in boiling dioxane (50 ml) and methyl bromoacetate (12.60 g, 90 mmoles) was added after the first reaction has completed. The excess of sodium hydride was destroyed with ethanol and the inorganics were filtered off. The solution was concentrated and 0.5 g of the residue was purified by chromatography (E2) to yield 320 mg of pure syrupy 10.

IR (AgCl): 1751 cm⁻¹ (CO).

'H nmr (CDCl₃): 3.68-3.88 (m, 7H, -OCH₂CH₂O-; CO₂CH₃); 4.29 (s, 2H, -OCH₂CO₂CH₃); 4.65 (s, 2H, PhCH₂); 7.42 (m, 5H, C₆H₅).

Anal. Calcd. for C₁₂H₁₆O₄ (224.261) C, 64.27; H, 7.19. Found : C, 64.41; H, 7.10.

Methyl 2-Benzylxoy-1-benzyloxymethylethoxyacetate (11). Prepared in a similar fashion as 10, from 9 (1.36 g, 5 mmoles), sodium hydride (0.36 g, 15 mmoles), and methyl bromoacetate (2.30 g, 15 mmoles). After chromatography (E2) pure 11 (1.00 g, 58%) was obtained as an oil. IR : 1754 cm⁻¹.

'H nmr (CDCl₃): 3.65 (d, 4H, Cl₂CHCl₂); 3.70 (s, 3H, CO₂CH₃); 3.80 (m, 1H, CH₂ClCH₂); 4.34 (s, 2H, -OC₂CH₂CONH₂); 4.53 (s, 4H, 2 x PhCH₂); 7.31 (m, 10H, 2 x C₆H₅).

2-Benzylxoyethoxyacetamide (12). Crude ester 10 (6.26 g) was dissolved in methanolic ammonia (100 ml) and was left to stand overnight. Chromatography (E6) provided 12 (3.30 g, 53 %, based on the alcohol 8) as a viscous syrup. IR : 550, 1594, 1683, 3190, 3316, 3454 cm⁻¹. 'H nmr (CDCl₃): 3.64 and 3.72 (each t, each 2H, -OCH₂CH₂O-; 4.00 (s, 2H, -OC₂CONH₂); 4.57 (s, 2H, PhCH₂); 6.06 and 6.98 (each bs, each 1H, CONH₂, deuterable); 7.34 (s, 5H, C₆H₅).

2-Benzylxoy-1-benzyloxymethylethoxyacetamide (13). From crude ester 11 (6.75 g) and methanolic ammonia (100 ml). Chromatography (E5) afforded oily 13 (3.85 g, 59 %, based on the alcohol 2) along with 9 (1.30 g, 24 %). IR : 542, 1593, 1687, 3180, 3385 cm⁻¹. 'H nmr (CDCl₃): 3.64 and 3.72 (each t, each 2H, -OCH₂CH₂O-); 4.00 (s, 2H, -OCH₂CONH₂); 4.57 (s, 2H, PhCH₂); 5.53 and 7.51 (each bs, each 1H, CONH₂, deuterable); 7.33 (s, 5H, C₆H₅).

2-Benzylxoythiocyacetamide (14). Amidic 12 (2.09 g, 10 mmoles) was dissolved in absolute dioxane (50 ml) and boiled with tetraphosphorus decasulphide (2.00 g, 4.50 mmoles) for 1 h. After evaporation and extractive work-up chromatography (E4) gave syrup 14 (1.10 g, 49 %). IR (AgCl): 1243, 3120, 3270 cm⁻¹. 'H nmr (CDCl₃): 3.67 and 3.73 (each m, each 2H, -OCH₂CH₂O-); 4.37 (s, 2H, OCH₂CSNH₂); 4.58 (s, 2H, PhCH₂); 7.33 (m, 5H, C₆H₅); 7.50 and 8.65 (each bs, each 1H, CSNH₂, exchangeable). Anal. Calcd. for C₁₁H₁₅N₂O₂ (225.313) C, 58.64; H, 6.71; N, 6.22; S, 14.23. Found : C, 58.85; H, 6.80; N, 6.10; S, 14.41.
2-Benzylbxy-1-benzylxoxymethylethoxythioacetamide (15). Amide 13 (1.76 g, 5.4 mmoles) and tetraphosphorus decasulphide (0.90 g, 2.02 mmoles) were refluxed for 1 h in absolute dioxane (40 ml). After work-up and chromatography (E4) pure crystalline thioamide 15 (1.32 g, 71%) was obtained, mp 72-73°C. \[\text{Ir: 1255, 3172, 3289 cm}^{-1}\].

\[\text{Hnmr (CDCl}_3\text{: 3.56 (d, 4H,Cli}_2\text{CHCli}_2\text{); 3.76 (m, 1H, CH}_2\text{CCI}_2\text{); 4.48 (s, 2H, OCH}_2\text{SCHNH}_2\text{); 4.54 (s, 4H, 2 x PhCH}_2\text{); 7.33 (m, 10H, 2 x C}_6\text{H}_5\text{); 9.24 (bs, 1H, CSNH}_2\text{, exchangeable, the pair of this signal is not detectable). Ms (m/z, %): 345 (5, M'); 271 (3, (B~OCH~)~C=OH'); 107 (76, P~CH=OH+); 91 (68, C~H~); 65 (33, c~H~); 60 (18, S=c=NH;).}\]

Anal. Calcd. for C19H17NO3S (345.463) C, 66.06; H, 6.71; N, 4.05; S, 9.28. Found: C, 66.23; H, 6.60; N, 4.14; S, 9.65.

Reaction of 15 with Ethyl Bromopyruvate in Acetonitrile at Room Temperature. Thioamide 15 (1.00 g, 2.90 mmoles) was dissolved in absolute acetonitrile (20 ml) and cooled to 0°C. This solution was added to an ice-cold acetonitrile solution of ethyl bromopyruvate (1.87 g, ca. 3 equiv. in 8 ml of solvent). After 5 min the ice-bath was removed and the reaction mixture was left to warm up to room temperature. The pale yellow colour of the solution turned into orange. After 1 h the solvent was removed, then the residue was extracted and chromatographed (E4) to furnish a yellow oil (0.732 g), which was too unstable to be correctly characterized. The ir spectrum of the partially decomposed product (tlc) showed an absorption at 1738 cm\(^{-1}\) and in the region of 3200-3500 cm\(^{-1}\). The pmr spectrum of the intermediate did not exhibit absorption above 8 ppm. This intermediate readily transforms into the stable thiazole 17 upon heating either in abs. ethanol or in ethanolic hydrogen chloride as judged by tlc. The attempted ammonolysis of the intermediate resulted in a very complex reaction mixture (tlc).

Ethyl 2-(2-Benzylxoyethoxymethyl)thiazole-4-carboxylate (16). Thioamide 14 (0.90 g, 3.99 mmoles) and ethyl bromopyruvate (1.7 ml, ca. 12 mmoles) was refluxed in ethanol for 2 h. In the first 10 min a deep yellow colour was formed, probably associated with formation of the intermediate, which, upon further heating, turned pale yellow. After evaporation and extraction, 0.47 g of the crude product (2.32 g) was purified by chromatography (E2) to yield pure ester 16 (243 mg) as an oil. \[\text{Ir: 1732 (CO), 3109 (\nu(C(5)=H) cm}^{-1}\]. \[\text{Hnmr (CDCl}_3\text{: 1.39 (t, 3H, CO}_2\text{CH}_2\text{C}_3\text{); 3.71 and 3.81 (each m, each 2H, -OCH}_2\text{CH}_2\text{O-); 4.43 (q, 2H, CO}_2\text{CH}_2\text{CH}_3\text{); 4.60 (s, 2H, PhCH}_2\text{); 4.92 (s, 2H, thiazolyl CH}_2\text{); 7.36 (m, 5H, C}_6\text{H}_5\text{); 8.44 (s, 1H, H-5). Ms (m/z, %): 321 (8, M'); 276 (11, M-DEt); 230 (12, M-C_6H_4); 186 (82, 29); 170 (49, 28); 107 (10, PHCH=OH'); 91 (100, C_7H_7'); 65 (26, C_5H_5').}\]

Anal. Calcd. for C_{16}H_{19}NO_4S (321.400) C, 59.79; H, 5.96; N, 4.36; S, 9.98. Found: C, 60.00; H, 5.92; N, 4.41; S, 9.73.

Ethyl 2-(2-Benzylxoy-1-benzylxoxymethylethoxymethyl)thiazole-4-carboxylate (17). Thioamide 15 (1.00 g, 2.90 mmoles) was refluxed for 2 h with ethyl bromopyruvate (1.20 ml, ca. 3 equiv.)
in ethanol. Work-up as usually, of the crude product 275 mg was subjected to chromatography (E3) to give 70 mg of pure oily 17. \( \text{IR} : 1727, 3106 \text{ cm}^{-1} \). \( ^1 \text{H} \text{nmr (CDCl}_3 \text{)} : 1.47 (m, 3H, CD}_2 \text{CH}_3 \); 3.73 (dd, 4H, CH\text{CH}_2 \text{CH}_2 \text{); } 4.03 (m, 1H, CH\text{CH}_2 \text{CH}_2 \text{); } 4.46 (q, 2H, CD}_2 \text{CH}_2 \text{); } 4.62 (s, 4H, 2 x PhCH}_2 \text{); } 5.17 (s, 2H, thiazolyl CH\text{); } 7.38 (s, 10H, 2 x C_6\text{H}_5 \text{); } 8.24 (s, 1H, H=5). \text{Ms} (m/z) : 441 (4, M\text{)}; 396 (3, M-DEt) ; 301 (350, M-C}_7\text{H}_7 \text{); 186 (31, 29) ; 170 (61, 28) ; 121 (32); 107 (18, PhCH=OH\text{)}; 91 (100, C}_7\text{H}_7 \text{); 65 (33, C}_5\text{H}_5 \text{)}; 29 (100, Et\text{)}^+. \text{Anal. Debenzylation of 18 to 4. A. Boron Trifluoride Etherate and Ethanethiol\text{.} Amide 18 (240 mg, 0.82 mmole) was dissolved in dichloromethane (20 ml), ethanethiol (1 ml, 13.4 mmole) and boron trifluoride etherate (2 ml, 16 mmole) were added and this solution was stirred for a day at room temperature. Saturated sodium bicarbonate solution was added and the aqueous solution was evaporated to dryness. The solid residue was extracted with hot methanol (3 x 30 ml). Evaporation and chromatography (E9) yielded 16 mg (9.6 %) of oily 4. \( \text{IR} : 1591, 1665, 3115, 3330 \text{ cm}^{-1} \). \( ^1 \text{H} \text{nmr (DMSO-d}_6 \text{)} : 3.57 (m, 4H, -OCH\text{CH}_2\text{CH}_2\text{O-}); 4.74 (bs, 1H, OH, deuterableView); 4.80 (s, 2H, thiazolyl CH\text{); } 7.53 and 7.69 (each bs, each 1H, CONH\text{), exchangeable}); 8.22 (s, 1H, H=5). \text{Ms} (m/z) : 157 (3, 31); 149 (3); 142 (6); 141 (10, 30); 125 (4); 60 (7); 58 (2, 27); 41 (9). \text{Anal. Calcd. for}
B. Boron Tribromide. Amide 10 (292 mg, 1 mmole) was dissolved in dichloromethane and chilled to -10°C, then 0.5 M boron tribromide solution (10 ml, 5 mmoles in dichloromethane) was added and the reaction mixture was stirred for 30 min at -10°C. Water (25 ml) quenched the reaction and the organic phase was further extracted with water (5 x 25 ml). The combined aqueous phases were concentrated to a small volume and applied to an Ion exchanger column. The uv active fractions were pooled and evaporated to yield an oil which was further purified by silica gel column chromatography (E9) and 130 mg (64.4 %) of A was obtained. All attempts to make this substance crystalline were unsuccessful. The spectral data of this substance were identical with those obtained for the previous entry.

2-(2-Hydroxy-1-hydroxymethylthoxymethyl)thiazole-4-carboxamide (5). Amide 19 (304 mg, 0.737 mmole) was treated with 0.5 M boron tribromide solution (8.90 ml, 4.45 moles) in dichloromethane as described above. Ion exchange and silica gel column chromatography (E9) afforded white crystalline 5 (108 mg, 63.1 %). mp 158-159°C. Ir: 1607, 1647, 1681, 3087, 3205, 3272, 3368 cm⁻¹. Found: C, 41.50; H, 5.44; N, 11.92; S, 13.27.

2-Benzoyloxyethoxythioacetamide (23). Nitrile 22 (4.07 g, 23.7 mmole) was stirred with liquid hydrogen sulphide (9 ml, 260 mmoles) and 4-dimethylaminopyridine (30 mg, 0.25 mmoles) for 22 h at room temperature in a sealed bomb. The hydrogen sulphide was allowed to evaporate, extraction and chromatography (E11) afforded crystalline 23 (3.46 g, 61%) along with starting nitrile 22 (1.04 g, 21%). An analytical sample was obtained after recrystallization from ethyl acetate - light petroleum, mp 98°C. Ir: 1249, 1695, 3206, 3267, 3389 cm⁻¹. ¹H nmr (CDCl₃ + D₂O): 3.91 (t, 2H, CO₂CH₂CH₂O⁻); 4.41 (s, 2H, CH₂CSNH₂); 4.54 (t, 2H, CO₂CH₂CH₂O⁻); 7.38-7.69 (m, 3H) and 8.04 (dd, 2H, aromatic). Ms (m/z, %): 239 (0.6, M⁺); 165 (8, M-CH₂CSNH₂); 149 (35, M-CH₂CSNH₂⁻); 117 (32); 105 (68, PhCO⁺); 75 (100); 60 (39, S=CNH₂⁺); 51 (55, C₄H₇⁺). Anal. Calcd. for C₁₄H₁₃N₂O₄S (339.297) C, 55.21; H, 5.48; N, 5.85; S, 13.40. Found: C, 55.22; H, 5.51; N, 5.80; S, 13.22.

Ethyl 2-(2-Benzoyloxyethoxymethyl)thiazole-4-carboxylate (24). Thioamide 23 (2.43 g, 10.16 mmoles) and ethyl bromopyruvate (3.90 g, ca. 2 equiv.) were refluxed for 4 h in ethanol (30 ml). After usual extractive work-up chromatography (E12) provided 24 (1.93 g, 57%) as a
yellowish oil. An analytical sample was obtained after preparative layer chromatography (E14).

Acyclonucleoside 4. Ester 3 (1.83 g, 5.45 mmoles) was allowed to react with methanolic ammonia (40 ml) for a week. Evaporation and aqueous extraction (3 x 50 ml) of the residue followed by chromatography (E7) provided 4 (0.98 g, 89 %) as a thick yellow oil. On standing, after some weeks, it began to crystallize, which was completed by ethereal trituration, mp 74-75 °C. An analytical sample was obtained after recrystallization from ethyl acetate at 60 °C. Anal. Calcd. for C\text{7}H\text{10}N\text{2}O\text{3}S (202.235) C, 41.57; H, 4.98; N, 13.85; S, 15.85. Found : C, 41.80; H, 5.00; N, 13.49; S, 15.41. Uv (λ, nm), EtOH: 207 (lg ε: 3.94); 233 (lg ε: 3.82). For other spectral data see above. The compound was identical in all respects with the previously obtained ones.

2-Benzylx-1-benzylxymethylethoxyacetonitrile (25). A. In Two Steps. Alcohol 9 (10.00 g, 36.7 moles) and paraformaldehyde (1.10 g, 36.7 moles of CH\text{2}O) were stirred in 1,2-dichloroethane (30 ml) in an ice-bath and dry hydrogen chloride was passed through the solution for 4 h. Evaporation of the dried solution gave the crude chloromethyl ether (11.38 g) which was directly used in the following reaction. Crude chloromethyl ether in absolute dichloromethane (30 ml), potassium cyanide (3.26 g, 50 moles) and dibenzo-18-crown-6 (90 mg, 0.25 moles) were vigorously stirred at room temperature for two days. Usual work-up and chromatography (E10) provided an oil (6.15 g, 54 %). Tlc and nmr indicated the presence of a small impurity.

8. Directly from Chloroacetonitrile. Alcohol 9 (1.36 g, 5 mmoles) was allowed to react with excess sodium hydride (0.41 g, 17.2 mmoles) in absolute dioxane (30 ml). Oxidation sodium iodide (0.75 g, 5 moles) and chloroacetonitrile (1.13 g, 15 mmoles) were added under reflux. The solution immediately turned into dark brown. The excess of sodium hydride was destroyed with ethanol, the inorganics were removed by filtration. Evaporation and extraction followed by chromatography (E10) gave 25 (0.52 g, 33 %) as a colourless oil. An analytical sample was obtained after preparative chromatography (E12). \[ \text{Ir: absence of nitrile band.} \]

\[ ^1\text{H nmr (CDCl}_3): 3.63 (d, 4H, CH}_2\text{CHCH}_2\text{); 3.95 (m, 1H, CH}_2\text{CHCO}_2\text{H); 4.48 (s, 2H, OCH}_2\text{CN); 4.53 (s, 4H, 2 x PhCH}_2\text{); 7.33 (m, 10H, 2 x C}_6\text{H}_5\text{). \[ \text{Anal. Calcd. C}_{19}\text{H}_2\text{NO}_3 (311.385) C, 73.29; H, 6.80; N, 5.50. Found : C, 73.49; H, 6.67; N, 5.59. This substance was identical in all respects with the previously gained one.} \]
Thioamide 15. Nitrile 25 (5.35 g, 17.17 mmoles) was treated with liquid hydrogen sulphide (16 ml, ca. 470 mmoles) in the presence of 4-dimethylaminopyridine (30 mg, 0.25 mmoles) at 50 °C for 65 h in a bomb. The hydrogen sulphide was allowed to evaporate. Usual extractive work-up followed by chromatography (E11) afforded crude 15 (2.09 g, 35 %), mp 62-71 °C, along with nitrile 25 (1.92 g, 36 %). The spectral data of this thioamide were identical with those of the previously described one.

Ethyl 2-(2-Acetoxy-1-acetoxymethylethoxymethyl)thiazole-4-carboxylate (26). Crude thioamide 15 (2.09 g, 6.06 mmoles) was refluxed with ethyl bromopyruvate (3.50 g, ca. 3 equiv.) in ethanol (25 ml) for 2 h. The solvent was removed in vacuo and ice-cold acetic anhydride (60 ml) and boron trifluoride etherate (2 ml, 16.7 mmoles) were added to the residue. The mixture was allowed to stand at room temperature for 16 h. Evaporation and extractive work-up followed by chromatography (E13) yielded 26 (1.16 g, 55 %) as an oil. Preparative layer chromatography (E14) provided an analytical sample. Ir : 1733, 3108 cm⁻¹. ¹H nmr (CDCl₃) : 1.43 (t, 3H, J = 7.0 Hz, CO₂CH₂CH₃); 2.10 (s, 6H, 2 x CH₃CO₂); 3.98 (m, 1H, CH₂CH₂CH₂); 4.24 (m, 4H, CH₂CH₂CH₂); 4.44 (q, 2H, J = 7.0 Hz, CO₂CH₂CH₃); 5.02 (s, 2H, thiazolyl CH₂); 8.20 (s, 1H, H-5). Ms (m/z, %) : 346 (61, M+1); 304 (10); 286 (11, M-AcO); 272 (7, M-CO₂Et); 258 (11); 186 (36, 29); 170 (52, 28); 159 (48, M-186); 142 (18); 125 (17); 100 (12); 43 (100, Ac⁺); 29 (19, Et⁺). Anal. Calcd. for C₁₇H₁₉N₃O₇S (345.378) C, 48.69; H, 5.54; N, 4.06; S, 9.28. Found : C, 48.80; H, 5.36; N, 3.81; S, 9.04.

Acyclonucleoside 5. Ester 26 (0.996 g, 2.88 mmoles) was dissolved in methanolic ammonia (30 ml) and allowed to stand at room temperature for 4 days. The crystalline precipitate (460 mg, mp 157-158.5 °C) was filtered off. From the mother liquor a further crop (120 mg, mp 151-152 °C) was obtained by chromatography (E8). Combined yield : 87 %. Recrystallization from ethanol raised the mp to 158-159 °C. This substance was identical in all respects with the compound obtained in an earlier experiment.

ACKNOWLEDGEMENT
We are very indebted to Dr. P. C. Srivastava (Oak Ridge National Laboratory, Tennessee, USA) for providing us a sample of authentic triazofurin.
