Abstract – Various aromatic and heterocyclic aldehydes were easily converted to respective nitriles with the combination of trimethylphenylammonium tribromide and ammonium acetate in good yields at room temperature.

Nitriles have been known to be effective for the synthetic intermediates of amides, amines, esters² and for the preparation of bioactive heterocycles such as imidazoles, tetrazoles, thiazoles.³ Aromatic nitriles from aryl diazonium salts were synthesized by Sandmeyer reaction and other alkyl nitriles were also prepared by the nucleophilic reaction of alkyl halides with inorganic cyanides.

As those methods using a stoichiometric amounts of inorganic cyanides were harmful and hazardous, there have been reported alternative methods such as methylarenes with NBS,^{4a} aryl halides with CuSCN,^{4b} or Zn (CN)₂,^{4c} and alkyl halides with TBACN.^{4d} Further, convenient transformation of primary alcohols,^{5a,5b} amines,^{5b,5c} and oxiranes^{5d} to nitriles was also reported respectively.

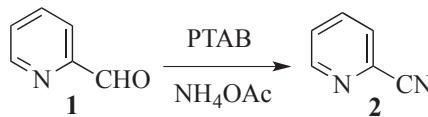

Moreover transformations of aldehydes to nitriles have been studied independently.⁶ The methods for producing nitriles via aldehyde derivatives such as aldoximes,⁷ aldehyde *N*-tosylimines,^{8a} aldehyde trimethylhydrazone iodides,^{8b} were also investigated. The Fe₃O₄-catalyzed one-pot three-component synthesis of α -aminonitriles from aldehydes, amines, and TMSCN was reported.⁹ The simple and economical synthesis of nitriles from aldehydes with hydroxylamine hydrochloride catalyzed by KF/Al₂O₃ was explored.¹⁰ Therefore, there is still considerable interest in investigating an alternative synthesis of various nitriles from aldehydes.

On the other hand, the methods for the oxidation of secondary alcohols to ketones,^{11a} the chemoselective conversion of aromatic epoxide to 1,3-dioxane derivatives,^{11b} and the transformation of alkoxyfurans to 3(2*H*)-furanones^{11c,11d} were achieved with commercially available trimethylphenylammonium tribromide (phenyltrimethylammonium tribromide, PTAB). The regioselective one-pot synthesis of 6-bromobenzothiazoles form arylaldehydes was also achieved with PTAB-SbBr₃.¹² The oxidation of

carbohydrates to keto-sugars was recently developed with PTAB-K₂CO₃ in the presence of organotin catalyst.¹³ Thus, the use of PTAB was expected to be attractive in oxidative organic syntheses. Zhu and Cai reported the synthesis of nitrile with tetrabutylammonium tribromide in aqueous ammonia.¹⁴ Therefore, it was seemed to be significant in finding a new oxidative procedure for preparation of nitriles from aldehydes with PTAB. Recently preparation of aromatic nitriles from aldehydes with pentylpyridinium tribromide in aqueous NH₄OAc was also reported by Bagherzade, Zali, and Sokrolahi.¹⁵ As we have also presented preliminary alternative reports for conversion of aldehydes to nitriles, we would like to report on the results of our studies concerning the one-pot synthesis of heterocyclic and aromatic nitriles from aldehydes with PTAB-NH₄OAc.¹

At first, the reaction of 2-pyridinecarbaldehyde (**1**), chosen as a representative heterocyclic aldehyde for this study, was carried out with various molar ratios of PTAB and NH₄OAc over **1** for obtaining 2-pyridinenitrile (**2**). The results are summarized in Table 1. At 2.0 molar ratios of PTAB and 10.0 molar ratios of NH₄OAc over **1** in CH₂Cl₂ at room temperature, 2-pyridinenitrile (**2**) was afforded in good yield (run 1). To examine the optimum amounts of PTAB for the synthesis of nitrile **2**, the reaction of **1** with 0.0-1.5 molar ratios of PTAB was carried out in the presence of 10.0 molar ratios of NH₄OAc over **1**. At 1.5 molar ratios of PTAB, the yield of **2** was 92%, accompanied by small amounts of recovered **1** (run 2). A mixture of nitrile **2** (84%) and recovered **1** (10%) was afforded at 1.0 molar ratio of PTAB over **1** (run 3). A complex mixture was given without PTAB under the same reaction conditions (run 4). Consequently, there is need to use at least more than 1.5 molar equivalents of PTAB over **1** for obtaining nitrile **2** in moderate yield.

To clarify the optimum amounts of NH₄OAc for conversion of **1** to nitrile **2**, the reaction of **1** with 1.0-8.0 molar ratios of NH₄OAc was also carried out in the presence of 2.0 molar ratios of PTAB over **1** respectively. At 8.0 molar ratios of NH₄OAc over **1**, the reaction of **1** with PTAB gave nitrile **2** in 95% yield(run 5). At 4.0-6.0 molar ratios of NH₄OAc over **1**, nitrile **2** was afforded in 84-87% yields, accompanied by 8-9% recovered **1** (runs 6, 7). The yields of **2** were not fully satisfactory, accompanied by recovered **1** (29-48%) at 1.0-2.0 molar ratios of NH₄OAc in the presence of 2.0 molar ratios of PTAB over **1** (runs 8, 9). The satisfactory yield of nitrile **2** was not observed at 1.0 molar ratio of PTAB and 6.0 molar ratio of NH₄OAc (run 10). In the present experiments, there is need to use at least 6.0-10.0 equivalents of NH₄OAc in the presence of 2.0 equivalents of PTAB over **1** for producing nitriles **2** quantitatively. Further, the reaction of **1** with ammonium oxalate or NH₄Cl instead of NH₄OAc was carried out to examine the effect of NH₄OAc in this method. At 6.0 molar ratios of ammonium oxalate in the presence of 2.0 molar ratios of PTAB, the yield of nitrile **2** was not fully satisfactory accompanied by recovered **1** (run 11). At 10.0 molar ratios of NH₄Cl, aldehyde **1** was recovered unchanged under the same reaction conditions (run 12). Accordingly, this one-pot synthesis of 2-pyridinenitrile **2** from

^a **1:** 0.5 mmol; Solvent: 6 mL; Temp: rt. ^b Complex mixture was obtained. ^c (CO₂NH₄)₂. ^d NH₄Cl. ^e PHPB was used instead of PTAB.

2-pyridinecarbaldehyde **1** was suggested to rest on the complementary function of PTAB and NH₄OAc.

To test the suitable solvents in this method, the conversion of **1** to **2** was carried out with PTAB-NH₄OAc in various solvents such as MeOH, MeCN, hexane, benzene, H₂O under the same reaction conditions. In MeOH, MeCN, hexane, **1** was converted to **2** in good yields respectively (runs 13-15). A mixture of nitrile **2** (48%) and recovered aldehyde **1** (47%) was afforded in benzene (run 16). H₂O was also found to be appropriate solvent for conversion of **1** to **2** (run 17). Consequently, it was found that the preparation of nitrile **2** from aldehyde **1** by PTAB-NH₄OAc was not rest on solvents excepting for benzene.

To examine the effect of ammonium tribromides, the conversion of **1** to **2** was carried out with pyridinium hydrobromide perbromide(PHPB) instead of PTAB in the presence of NH₄OAc in various solvents. Nitrile **2** was respectively given with PHPB in 92-94% yields in CH₂Cl₂, MeOH, MeCN, hexane, H₂O under the same reaction conditions (runs 18-22). Accordingly, the combination of ammonium tribromides, PTAB or PHPB and NH₄OAc was confirmed to be alternative convenient one-pot procedure for conversion of 2-pyridinecarbaldehyde **1** to 2-pyridinenitrile **2**.

^aS: 0.5 mmol; PTAB: 1.0 mmol; NH₄OAc: 5.0 mmol; CH₂Cl₂: 6.0 mL; Temp: rt. ^bMeCN was used instead of CH₂Cl₂. ^cS: 0.25 mmol. ^dS: 0.25 mmol; PTAB: 1.0 mmol; NH₄OAc: 5.0 mmol; MeCN: 6.0 mL; Temp: rt.

To elucidate the limitations for this conversion of heterocyclic aldehydes to nitriles, the reaction of various heterocyclic aldehydes was examined with PTAB-NH₄OAc. The results of the reaction of heterocyclic aldehydes are shown in Table 2. The reaction of 3-pyridinecarbaldehyde (**3**), 4-pyridinecarbaldehyde (**5**), and 6-methyl-2-pyridinecarbaldehyde (**7**) took place to give corresponding nitriles (**4**), (**6**), (**8**) respectively (runs 2-4). 2,6-Pyridinedicarbaldehyde (**9**) was similarly converted to dinitrile(**10**) in good yield (run 5).

The reaction of quinolinecarbaldehydes, 2-formylthiazole was also carried out with PTAB-NH₄OAc to clarify the chemoselectivity for conversion of heterocyclic aldehydes to nitriles. The reaction of 2-, 3-, 4-, and 8-quinolinecarbaldehydes (**11**), (**13**), (**15**), (**17**) also took place to give corresponding nitriles (**12**), (**14**), (**16**), (**18**) in good yields (runs 6-9). 2-Formylthiazole (**19**) was converted to nitrile (**20**)(run 10).

A variety of heterocyclic nitriles were found to be easily prepared from respective aldehydes with PTAB-NH₄OAc.

To test the application for other aldehydes by this PTAB-NH₄OAc system, the reaction of various aromatic aldehydes was carried out under the same reaction conditions. The results of aromatic aldehydes are shown in Table 3. Benzaldehyde (**21**) was converted to benzonitrile (**22**) (run 1). The reaction of *o*-, *m*-, and *p*-tolualdehydes (**23**), (**25**), (**27**) took place to give corresponding nitriles (**24**), (**26**), (**28**) in 64-73% yields, accompanied by respective recovered aldehydes (runs 2-4). *o*-, and *p*-Nitrobenzaldehydes

^a S: 0.5 mmol; PTAB: 1.0 mmol; NH₄OAc: 5.0 mmol; MeCN: 6.0 mL; Temp: rt. ^b Recovered 23: 22%.

^c Recovered 25: 32%. ^d Recovered 27: 28%. ^e S: 0.25 mmol; PTAB: 1.0 mmol; NH₄OAc: 5.0 mmol; MeCN: 6.0 mL; Temp: rt.

(29) (31) were converted to nitriles (30), (32) (runs 5,6). *o*-, *m*-, and *p*-Chlorobenzaldehydes (33), (35), (37) were converted to corresponding nitriles (34), (36), (38). *o*-, *m*-, and *p*-Bromobenzaldehydes (39), (41), (43) were also converted to respective nitriles (40), (42), (44) in good yields (runs 7-12). Further, 2-phenylpropionaldehyde (45) and 3-phenylpropionaldehyde (47) were similarly converted to nitriles (46), (48) (runs 13, 14). Thus, the conversion of aromatic aldehydes to nitriles with PTAB-NH₄OAc was not rested on the substituents of aromatic ring.

The PTAB-NH₄OAc system was confirmed to be useful for conversion of heterocyclic and aromatic aldehydes to corresponding nitriles in various solvents.¹

Since aromatic and heterocyclic nitriles are of particular interest as key intermediates in the syntheses of biologically active compounds by amidation and ester exchange reactions, the combination of ammonium tribromides, PTAB or PHPB and NH₄OAc provides a significant alternative method for the synthesis of various nitriles from aldehydes.^{1,16,17}

16. Typical procedure: To a solution of 2-pyridinecarbaldehyde **1** (54 mg, 0.5 mmol) and ammonium acetate (385 mg, 5.0 mmol) in MeCN (6 mL), was added trimethylphenylammonium tribromide (376 mg, 1.0 mmol) at room temperature. After stirring for 21 h at rt, the reaction mixture was treated with 0.5 M aq. Na₂S₂O₃(10 mL), 1.0 M NaHCO₃ (15 mL) and extracted with EtOAc (60 mL). The organic layer was washed with 0.5 M Na₂S₂O₃ and successively washed with saturated aq. NaCl, and dried over MgSO₄. After removal of solvent in vacuo, the residue was purified by column chromatography on silica gel (Wako C-200) with CCl₄, CCl₄-CHCl₃ (2:1 v/v). 2-Pyridinenitrile **2** (49 mg, 0.47 mmol) was obtained in 95% yield. **2**: IR (neat, cm⁻¹) 3059, 3021, 2926, 2236, 1597, 1581, 1571, 1462, 1432, 1287, 1248, 1217, 1154, 1091, 1045, 992, 780, 756, 667, 631. ¹H NMR (CDCl₃) δ 7.53-7.58(1H, m), 7.73(1H, d, *J*=8.1 Hz), 7.88(1H, dd, *J*=8.1, 2.7 Hz), 8.75(1H, d, *J*=2.7 Hz). ¹³C NMR (CDCl₃) δ 117.16, 126.89, 128.49, 133.93, 136.99, 151.08.
17. The reaction of 2-pyridinecarbaldehyde **1** (10 mmol, 1.07 g) was carried out as follows: To a solution of 2-pyridinecarbaldehyde (1.07 g) in MeCN (50 mL) were added NH₄OAc (7.70 g, 0.1 mol) and PTAB (7.53 g, 20 mmol). After stirring for 18 h at rt, the precipitated trimethylphenylammonium bromide (ca. 8.32 g) was filtered off, washed with MeCN (15 mL). The combined filtrate was treated with 0.5 M aq. Na₂S₂O₃ (30 mL), 1.0 M aq. NaHCO₃ (60 mL) and extracted with EtOAc (100 mL). The organic layer was washed with 0.5 M aq. Na₂S₂O₃ (30 mL), successively saturated aq. NaCl (50 mL), and dried over MgSO₄. After removal of solvent in vacuo, the residue was purified by column chromatography (φ 20 mm, L 140 mm) on silica gel (Merck, Kieselgel Type 60, 230-400 mesh) with CCl₄, CCl₄ and CHCl₃(2:1 v/v). 2-Pyridinenitrile **2** (852 mg) was obtained.
