Abstract – Here, we report a new synthetic approach to oxa-cage systems by employing RCM as a key step. These cage systems were assembled starting with easily accessible starting materials by adopting a three-step sequence involving the Grignard addition, allylation followed by RCM.

INTRODUCTION
Since 1970’s, research on cage molecules has increased gradually.1,2 Recently, the emphasis has been shifted towards the development of efficient synthetic strategies to cage molecules with the aim of producing materials suitable as solid propellants. In view of their applications in diverse areas of chemistry such as synthesis of natural products,3 medicinal chemistry,4 pharmaceutical applications, design of new strategies to these molecules is highly desirable activity.5 Additionally, cage systems serve as useful candidates in high energy materials,6 polymers,7 thermostable oils,8 supramolecular chemistry,9 and in proposing various ligands suitable for chelation with selected metal ions.10 Due to the rigidity associated with their compact skeletons, synthesis of these molecules has become a worthwhile challenge. Moreover, these molecules possess an unusual strain energy and also show deviation from normal C–C bond angles and consequently they tend to undergo unusual molecular rearrangements.11 Therefore, considerable interest has been directed in studying acid catalyzed rearrangement of cage propellanes.12 Moreover, Lewis acid mediated rearrangement offers a unique opportunity to assemble unusual cage systems. Several reports are available for the synthesis of oxa-cage molecules (1-6).13 As part of our ongoing research program aimed at designing intricate molecules based on metathesis,14 here, we conceived ring-closing metathesis (RCM) approach to generate highly functionalized oxa-cage systems. In this regard, we identified cage diones 8-10 as useful starting materials.

RESULTS AND DISCUSSION

In view of our interest in designing new strategies for the construction of different cage molecules, we chose various building blocks 8-10 useful for assembling oxa-cage systems. These precursors were prepared from the annulated quinone derivative 7 by adopting a two-step synthetic sequence involving [4+2] reaction using suitable diene partners followed by [2+2] cycloaddition reaction as key steps.

Initially, we assembled the known cage systems 8, 9, and 10 via a Diels–Alder reaction with an appropriate diene partners followed by [2+2] cycloaddition of the resulting cycloadduct (Scheme 1). To build the
oxygen containing cage systems with spiro linkage, the cage dione 8 was treated with allylmagnesium bromide 11 in dry THF at 0 °C to room temperature for 3 h to deliver the expected diol 12 (91%). Next, the diol was subjected to allylation using 8 equivalents of allyl bromide (13) in the presence of NaH (8 equivalents) in dry DMF for 5 h to afford the mono-O-allyl product 14 (78%). Further, to realize the di-O-allylation we used a large amount of allyl bromide and NaH, then the reaction mixture was stirred for extended period (i.e., 2 days). Even under forcing reaction conditions, we did not observe the formation of di-O-allyl product. Next, exposure of the triallyl compound 14 to the metathesis catalyst, G-II, furnished the unsaturated cyclized ether 15 (85%). Subsequently, reduction of the cyclized product 15 was accomplished with H2, Pd/C to deliver the saturated oxa-cage system 16 in 83% yield (Scheme 2; \( n = 0 \)). Structures of these compounds 12, 14, 15, and 16 were determined by \(^1\)H NMR, \(^13\)C NMR spectral data and further supported by HRMS information. Finally, the structure and stereochemistry of hydroxyl groups present in compound 12 was unambiguously established by single-crystal X-ray diffraction studies\(^1\) (Figure 2).

Scheme 2. Synthesis of oxa-cage systems 16, 20, and 24

Along similar lines, the cyclopropane bearing cage dione 9 was treated with Grignard reagent 11 to provide the expected diol 17 (84%). Later, allylation of the diol 17 furnished the mono-O-allyl product 18 (86%). Next, triallyl compound 18 was subjected to the metathesis sequence with G-II catalyst to deliver the
cyclized product 19 (81%). Finally, reduction of the metathesis product with the aid of H\textsubscript{2}, Pd/C led to the formation of the saturated oxa-cage system 20 in 90% yield (Scheme 2; \(n = 2\)). Structure of these compounds 17, 18, 19, and 20 were determined by \textsuperscript{1}H NMR, \textsuperscript{13}C NMR spectral values and further supported by HRMS data.

Similarly, treatment of the cage dione 10 with Grignard reagent 11 produced the diol 21 (84%). The mono-\(O\)-allylated product 22 (82%) was obtained via allylation of diol 21 using allyl bromide 13 in the presence of NaH. Later, the triallyl compound 22 was subjected to metathesis with G-II catalyst to deliver the ring closure product 23 (80%), which on subsequent reduction with H\textsubscript{2}, Pd/C produced the oxa-cage system 24 in 87% yield (Scheme 2; \(n = 4\)). Structure of the compounds 21, 22, 23, and 24 were determined by \textsuperscript{1}H NMR, \textsuperscript{13}C NMR values and further supported by HRMS spectroscopic data. It is worth mentioning that during the course of allylation sequence with an excess amount of allyl bromide 13 (or excess amount of NaH) and longer reaction time was not useful to realize the diallylation of compound 21. It may be due to the steric hindrance associated with the triallyl compound 22.

We have demonstrated a simple and an efficient three-step synthetic sequence to assemble highly functionalized oxa-cage systems such as 16, 20 and 24 staring with cage diones 8-10 as key precursors. Here, we employed Grignard addition, allylation and RCM as key steps. Feasibility of RCM protocol to construct oxa-cage systems bearing cyclopropane and cyclopentane rings was realized.
EXPERIMENTAL

General Experimental Details
All the required reagents, chemicals and solvents were purchased from the commercial suppliers and used as without any further purification. Analytical TLC was performed on (10 × 5) glass plates coated with Acme’s silica gel (GF-254) containing 13% calcium sulfate as a binder. All the reactions were monitored by TLC using suitable solvent system and visualization was done under UV light, exposure to iodine vapour and by dipping in to a solution of KMnO₄. Dry reactions were performed in oven dried glassware under nitrogen atmosphere by using standard syringe-septum techniques. Acme’s silica gel (100-200 mesh size) and neutral alumina was used for column chromatography and solvents were concentrated under vacuo on rotary evaporator. Benzene and DCM were distilled from P₂O₅ or CaH₂ and EtOAc was dried by using K₂CO₃.

IR spectra were collected on a Nicolet Impact-400 FTIR spectrometer and samples were prepared as a thin film between CsCl plates by dissolving the compound in DCM and CHCl₃ and then evaporating the solvent. ¹H NMR (400 and 500 MHz), ¹³C NMR, ¹³C-APT NMR, DEPT 135 NMR (100 and 125 MHz) spectra were recorded on Bruker spectrometer and samples were prepared in CDCl₃ solvent. The chemical shifts are reported in parts per million (ppm) on delta scale with TMS as an internal standard and values for the coupling constants (J) are given in Hz. The standard abbreviations for ¹H NMR spin couplings are given as s, d, t, q, dd, dt, td, and m for singlet, doublet, triplet, quartet, doublet of doublet, doublet of triplet, triplet of doublet and multiplet respectively. High-resolution mass spectra (HRMS) were recorded in a positive ion electrospray ionization (ESI). All melting points were recorded on Veego VMP-CMP melting point apparatus and are uncorrected. All reported yields are isolated yields of the products after column purification. X-Ray data were recorded on diffractometer equipped with graphite monochromatic Mo Kα radiation and structure was solved by direct methods shelxl-97 and refined by full-matrix least-squares against F² using shelxl-97 software.

General Procedure for Allyl Grignard Addition to Cage Diones 8, 9 and 10
To a freshly prepared allylmagnesium bromide solution in dry Et₂O was added to the cage diones 8, 9 and 10 in dry Et₂O (200 mg, 0.93 mmol for 8 or 150 mg, 0.62 mmol for 9 or 100 mg, 0.37 mmol for 10) by dropwise addition over a period of 10 min under continuous flow of nitrogen at room temperature. After conclusion of the reaction (3 h for 8, 2 h for 9 and 3 h for 10, reaction progress monitored by TLC monitoring, the reaction mixture was quenched with saturated aq. NH₄Cl solution at 0 °C, and the resulting aqueous layer was extracted with EtOAc. The combined organic layers were washed with brine and dried over anhydrous Na₂SO₄. Solvent was evaporated under vacuum and the resulting crude residue was subjected to silica gel column chromatography (10 to 15% EtOAc/petroleum ether as an eluent) to afford pure 12 as a colorless crystalline solid, 17 and 21 as a colorless liquid.

**General Procedure for Synthesis of RCM Precursors 14, 18, and 22**

To a suspension of sodium hydride (2.2-5.3 mmol, 8 equiv) in anhydrous DMF (5-10 mL) was added to cage diols 12, 17, and 21 (0.28-0.67 mmol, 1 equiv) under nitrogen at 0 °C. Then the reaction mixture was stirred for 15 min at room temperature. Later on, allyl bromide (2.2-5.3 mmol, 8 equiv) was added and then stirring was continued for 5-8 h. At the end of the reaction (TLC analysis), the crude reaction mixture was quenched with saturated aq. NH₄Cl and the resulting aqueous layer was extracted with EtOAc. The combined organic layers were washed with brine and dried over anhydrous Na₂SO₄. The solvent was evaporated under reduced pressure and the resulting crude residue was subjected to silica gel column chromatography using 2-3% EtOAc/PE as an eluent to afford pure 14, 18, and 22 respectively, as colorless liquids.

**General Procedure for Synthesis of 16, 20 and 24 via Catalytic Hydrogenation**

To a stirred solution of RCM products 15, 19 and 23 (0.20-0.32 mmol, 1 equiv) in dry EtOAc (5 mL), 10 mol% (8-10 mg) Pd/C was added. Then the resulting reaction mixture was stirred at room temperature for 4-5 h under hydrogen atmosphere (1 atm). After completion of the reaction by TLC evident, the reaction mixture was filtered through Celite pad and washed with EtOAc (10 mL). The combined washings and filtrate was evaporated under vacuum and the resulting crude residue was purified by silica gel column chromatography using 4-7% EtOAc/PE as an eluent to afford the hydrogenated products 16, 20 and 24 as color liquids.

**Compound 16:** Colorless liquid; prepared from compound 15 (100 mg, 0.32 mmol); Yield: 84 mg (83%); IR (neat, cm⁻¹): 3313, 2955, 2870, 1451, 1277, 1086, 1042; ¹H NMR (500 MHz, CDCl₃): δ 6.63 (d, J = 2.2 Hz, 1H), 3.86-3.83 (m, 1H), 3.75-3.70 (m, 1H), 2.78-2.76 (m, 1H), 2.29-2.25 (m, 3H), 1.99-1.86 (m, 3H), 1.68-1.62 (m, 5H), 1.57-1.46 (m, 8H), 1.44-1.30 (m, 2H), 1.25-1.81 (m, 1H), 0.89 (t, J = 7.2 Hz, 3H) ppm; ¹³C NMR (125 MHz, CDCl₃): δ 81.0, 76.6, 65.2, 58.2, 57.4, 50.0, 44.2, 43.6, 43.48, 43.43, 42.2, 39.9, 34.5, 31.3, 29.0, 28.7, 25.8, 25.3, 19.0, 15.8, 15.1 ppm; HRMS (ESI): m/z calcd for C₂₁H₃₀NaO₂ [M+Na]+: 337.2138; found: 337.2137.

**Compound 20:** Colorless liquid; prepared from compound 19 (75 mg, 0.22 mmol); Yield: 69 mg (90%); IR (neat, cm⁻¹): 3230, 2949, 2355, 1640, 1491, 1268, 1227, 1154, 1129, 914; ¹H NMR (400 MHz, CDCl₃): δ 6.65 (d, J = 2.0 Hz, 1H), 3.86-3.84 (m, 1H), 3.78-3.73 (m, 1H), 3.02-3.00 (m, 1H), 2.48-2.46
(m, 1H), 2.16-2.12 (m, 2H), 1.89-1.85 (m, 1H), 1.66-1.52 (m, 9H), 1.50-1.42 (m, 5H), 1.35-1.26 (m, 2H),
1.14-1.08 (m, 1H), 0.86 (t, \(J = 7.0\) Hz, 3H), 0.53-0.47 (m, 2H), 0.35-0.29 (m, 2H) ppm; \(^{13}\)C NMR (100
MHz, CDCl\(_3\)): \(\delta\) 80.9, 76.5, 65.2, 58.3, 57.5, 50.6, 50.4, 49.5, 44.2, 43.8, 42.6, 39.6, 31.0, 30.7, 29.1, 28.8,
25.7, 25.3, 18.9, 15.7, 15.1, 5.2, 4.8 ppm; HRMS (ESI): \(m/z\) calcd for C\(_{23}\)H\(_{32}\)NaO\(_2\) [M+Na\(^{+}\)]: 363.2295; found: 363.2294.

**Compound 24:** Colorless liquid; prepared from compound 23 (75 mg, 0.20 mmol); Yield: 66 mg (87%);
IR (neat, cm\(^{-1}\)): 3379, 3077, 3013, 2945, 2857, 1639, 1446, 1337, 1215, 1185, 1047, 998, 912; \(^{1}\)H
NMR (500 MHz, CDCl\(_3\)): \(\delta\) 6.77 (s, 1H), 3.86-3.83 (m, 1H), 3.76-3.72 (m, 1H), 2.92-2.90 (m, 1H),
2.40-2.38 (m, 1H), 2.08-2.01 (m, 2H), 1.90-1.82 (m, 3H), 1.70-1.50 (m, 12H), 1.49-1.43 (m, 5H),
1.41-1.11 (m, 6H), 1.88 (t, \(J = 7.0\) Hz, 3H) ppm; \(^{13}\)C NMR (125 MHz, CDCl\(_3\)): \(\delta\) 81.1, 76.8, 65.1, 57.6,
56.7, 56.1, 52.8, 51.9, 49.8, 43.6, 43.3, 42.4, 39.7, 32.2, 31.2, 30.3, 29.1, 28.8, 26.0, 25.8, 25.7, 25.2, 18.9,
15.7, 15.1 ppm; HRMS (ESI): \(m/z\) calcd for C\(_{25}\)H\(_{36}\)NaO\(_2\) [M+Na\(^{+}\)]: 391.2607; found: 391.2603.

**ACKNOWLEDGEMENTS**

We thank Defense Research and Development Organization (DRDO, NO. ARDB/01/1041849/M/1), New Delhi-India for the financial support. S.K. thanks Department of Science and Technology (DST, NO. SR/S2/JCB-33/2010), DST, New Delhi, India for the award of a J. C. Bose fellowship and Praj industries for Chair Professorship (Green Chemistry). The authors also thank to Mr. D. Mhatre for his help in collecting the X-ray crystal data and structure refinement. S.R.C. thanks University Grants Commission (UGC), New Delhi, India for the award of a research fellowship.
