Abstract – Phytochemical investigation of Arenga pinnata (Wurmb.) Merr. fruits led to the isolation of 5 new compounds, designated A. pinnata A-E (1–5), and 13 known compounds (6–18). All compounds were isolated from A. pinnata for the first time. Their chemical structures were identified based on extensive spectroscopic methods, including HR-ESI-MS, 1D and 2D-NMR. To the best of our knowledge, this is the first systematic scientific study on the chemical composition of the Arenga genus.

INTRODUCTION

Arenga pinnata (Wurmb.) Merr. are tall evergreen trees in the genus Arenga of the family Palmae. They are widely distributed in Southern China and Southeast Asia.1 They are widely used as folk remedies and were first found in “Kai Bao Ben Cao” of the Song Dynasty and “Ben Cao Hui Yan” of the Ming Dynasty.2,3 In folk medicines, people used to soak A. pinnata in wine, which has a remarkable effect on the painful parts of the body.4 They are abundant, and there is a huge development space.5 However, there is almost no current research on A. pinnata, and its main effective medicinal component remains unclear. Palm plants contain terpenes, alcohols, alkanes, esters, phenols, quinones, aldehydes and alkaloids.6 This research is the first systematic study of A. pinnata fruit using modern spectroscopy and chromatographic techniques. The crude product was separated and identified to include a new flavonoid, a new lignin compound, 2 new glycosides, a new O-containing heterocycle compound and 13 known compounds...
(6–18) (Figure 1). This study plays an important role in expanding the diversity of *A. pinnata* chemical components.

**Figure 1.** Structures of compounds 1–18 from *A. pinnata* fruits
RESULTS AND DISCUSSION

Compound 1 has the molecular formula of C_{23}H_{18}O_{7} according to HR-ESI-MS at m/z 407.1125 [M+H]^+.

The \(^1\)H-NMR data of 1 displayed 1 group of ABX coupling systems with proton signals at \(\delta_H 6.76\) (1H, br. s), 6.65 (1H, s), 6.64 (1H, br. s) and 1 group of AABB coupling systems with proton signals at \(\delta_H 7.34\) (2H, d, \(J = 8.6\) Hz), 6.82 (2H, d, \(J = 8.6\) Hz). All proton signals were assigned by HSQC analysis. A proton at \(\delta_H 8.0\) (1H, s) was ascribed to \(\delta_C 154.5\) (C-2) for the HMBC correlation from \(\delta_H 8.0\) (1H, s) to \(\delta_C 182.6\) (C-4), and a proton at \(\delta_H 6.29\) (1H, s) was ascribed to \(\delta_C 99.9\) (C-6) for the HMBC correlation from \(\delta_H 6.29\) (1H, s) to \(\delta_C 163.4\) (C-7), 161.6 (C-5), so it was considered to be located at the flavonoid skeleton. The HMBC correlation from \(\delta_H 1.68\) (3H, d, \(J = 7.2\) Hz) to \(\delta_C 113.0\) (C-8) led to the connection of 7''-phenylethyl to \(\delta_C 113.0\) (C-8) of the flavonoid skeleton. Combined with DEPT-135 and \(^{13}\)C-NMR data, compound 1 presented signals for 23 carbons, including 21 aromatic carbons (\(\delta_C 182.6, 163.4, 161.6, 158.8, 157.2, 154.5, 145.7, 144.0, 138.3, 131.4, 131.4, 124.3, 123.4, 119.5, 116.3, 116.3, 115.9, 115.7, 113.0, 106.5, 99.9\)), 1 methyl carbon (\(\delta_C 18.4\)), and 1 tertiary carbon signal (\(\delta_C 33.6\)). The connectivity of these partial structures and their functional groups was investigated by an analysis of HMBC. As shown in Figure 2, long-range correlations were observed between the following: H-7'' (CH) and C-7, C-8, C-9, C-1'', C-2'', C-6''; H-2 (CH) and C-3, C-4, C-9, C-1'; H-8'' (Me) and C-1'', C-7'', C-8.

| Table 1. \(^1\)H- and \(^{13}\)C-NMR Data of 1–5 (\(\delta_H 400\) MHz, \(\delta_C 100\) MHz in CD\(_3\)OD) |
|---|---|---|---|
| NO. | \(\delta_H\) \((J, \text{Hz})\) | \(\delta_C\) | \(\delta_H\) \((J, \text{Hz})\) | \(\delta_C\) |
| 2 | 8.0 (s) | 154.5 | 1 | 132.3 |
| 3 | 124.3 | 2 | 6.94 (s) | 111.8 |
| 4 | 182.6 | 3 | | 149.1 |
| 5 | 161.6 | 4 | | 147.4 |
| 6 | 6.29 (s) | 99.9 | 5 | 6.78 (m) | 116.0 |
| 7 | 163.4 | 6 | 6.78 (m) | 121.5 |
| 8 | 113.0 | 7 | 4.19 (d, 6.6) | 83.8 |
| 9 | 157.2 | 8 | 3.66 (m) | 77.2 |
| 10 | 106.5 | 9 | 3.47 (dd, 11.3, 3.8) | 64.0 |
| | | | 3.30 (m) | |
| 1' | 123.4 | 1' | 3.35 (m) | 69.7 |
| 2',6' | 7.34 (d, 8.6) | 131.4 | 2' | 1.54 (m) | 33.0 |
Based on the obtained data, the structure was established as 8-(7‴-(3‴,4‴-dihydroxyphenyl)-ethy1)-4‴,5,7-trihydroxyisoflavone and named A. pinnata A (Table 1; Figure 1).

Compound 2 has the molecular formula of C_{9}H_{16}O_{4} according to HR-ESI-MS at m/z 189.1117 [M+H]^+.

The $^1$H-NMR data of 2 displayed 1 methyl group at $\delta_H$ 0.93 (3H, t, $J = 7.5$ Hz), 5 methylene groups at $\delta_H$ 3.86 (dd, $J = 12.3$, 2.9 Hz), 3.84 (br d, $J = 12.3$ Hz); 3.37 (1H, m), 3.51 (1H, m); 2.78 (1H, dd, $J = 2.1$, 17.6 Hz), 2.58 (1H, dd, $J = 5.8$, 17.6 Hz); 1.65 (2H, m) and 1.35 (2H, m), respectively. Combined with DEPT-135, HSQC and $^{13}$C-NMR data, compound 2 presented signals for 9 carbons, including 1 methyl carbon ($\delta_C$ 14.2), 5 methylene carbon signals ($\delta_C$ 70.6, 36.7, 61.1, 32.9, 20.4), 2 tertiary carbon signals ($\delta_C$ 85.9, 76.8), and 1 quaternary carbon signal ($\delta_C$ 178.0). In the HMBC spectrum, the correlations between $\delta_C$ 76.8 (C-4) and H-1′ and between $\delta_C$ 70.6 (C-1′) and $\delta_H$ 4.26 (1H, q, $J = 4.7$ Hz) suggest that the butoxy group must be attached to C-4. As shown in Figure 2, long-range correlations were observed between the following: H-3 (CH$_2$) and C-2 (C=O), C-4, C-5; H-4 (CH) and C-3, C-2(C=O), C-5, C-6, C-1′; H-5 (CH) and C-3, C-4, C-6; H-6 (CH$_2$) and C-4, C-5. The observed coupling constants of H-4 ($J_{3,4} = 17.6$ Hz, $J_{3,4} = 17.6$, 2.1 Hz and $J_{4,5} = 4.7$ Hz), H-5 ($J_{4,5} = 4.6$ Hz) and H-6 ($J_{5,6} = 12.3$, 2.9 Hz, $J_{5,6} = 12.3$ Hz) in the $^1$H-NMR spectrum were identical to those of H-4 ($J_{3,4} = 17.1$, $J_{3,4} = 17.1$, 2.9 Hz and $J_{4,5} = 5$ Hz), H-5 ($J_{4,5} = 5$ Hz) and H-6 ($J_{5,6} = 12.7$, 2.9 Hz, $J_{5,6} = 12.7$ Hz) in trans-4-methoxy-5-methoxymethylxolan-2-one.$^8$$^{10}$ Based on the obtained data, the structure was established as trans-4-butoxyl-5-methoxymethylxolan-2-one and named A. pinnata B (Table 2; Figure 1).
Compound 3 has the molecular formula of C_{10}H_{18}O_{7} according to HR-ESI-MS at m/z 251.1125 [M+H]^+. The \(^\text{1}^H\)-NMR spectrum of 3 showed the characteristic signals of 2 methyl at δ\(^\text{H}\) 2.22 (3H, s) and 1.31 (3H, d, J = 6.9 Hz), 2 methine signals at δ\(^\text{H}\) 4.33 (1H, d, J = 8.5 Hz) and 4.18 (1H, q, J = 6.8 Hz), respectively. Combined with DEPT-135, HSQC and \(^{13}\text{C}\)-NMR data, compound 3 exhibited signals for 10 carbons, including 2 methyl carbons (δ\(^\text{C}\) 25.8, 17.0), 1 tertiary carbon signal (δ\(^\text{C}\) 81.7), 1 quaternary carbon signal (δ\(^\text{C}\) 213.2), and 1 glucose group (δ\(^\text{C}\) 103.7, 78.1, 75.0, 71.5, 78.0, 62.7). The \(^\text{1}^H\)-\(^\text{1}^H\) COSY and HSQC analysis of 3 is shown in Figure 2. In the HMBC spectrum, the correlations between δ\(^\text{C}\) 81.7 (C-1) and δ\(^\text{H}\) 4.33 (1H, d, J = 8.5 Hz) and between δ\(^\text{C}\) 103.7 (C-1') and δ\(^\text{H}\) 4.18 (1H, q, J = 6.8 Hz) suggest that the glucose group must be attached to C-1. As shown in Figure 2, long-range correlations were observed between the following: H-4 (CH\(_3\)) and C-1, C-2 (C=O); H-3 (Me) and C-1, C-2 (C=O). According to the literature,\(^{11,12}\) the structure was established as 3-oxobutan-2-yl-beta-D-glucoside and named A. pinnata C (Table 2; Figure 1).

Compound 4 has the molecular formula of C_{12}H_{22}O_{8} according to HR-ESI-MS at m/z 295.1385 [M+H]^+. The \(^\text{1}^H\)-NMR data of 4 displayed 3 methyl groups at δ\(^\text{H}\) 2.25 (3H, s), 1.29 (3H, s) and 1.13 (3H, d, J = 6.4 Hz), 2 methine protons at δ\(^\text{H}\) 4.31 (1H, d, J = 7.7 Hz) and 4.04 (1H, q, J = 6.4 Hz). Combined with DEPT-135, HSQC and \(^{13}\text{C}\)-NMR data, compound 4 exhibited signals for 12 carbons, including 3 methyl carbons (δ\(^\text{C}\) 26.7, 21.8, 14.4), 1 signal of tertiary carbon (δ\(^\text{C}\) 79.1), 2 quaternary carbon signals (δ\(^\text{C}\) 215.1, 82.3), and 1 glucose group (δ\(^\text{C}\) 101.7, 78.0, 77.9, 74.9, 71.7, 62.8). The \(^\text{1}^H\)-\(^\text{1}^H\) COSY and HSQC analysis of 4 is shown in Figure 2. In the HMBC spectrum, the correlations between δ\(^\text{C}\) 79.7 (C-1) and δ\(^\text{H}\) 4.31 (1H, d, J = 7.7 Hz) and between δ\(^\text{C}\) 101.7 (C-1') and δ\(^\text{H}\) 4.04 (1H, q, J = 6.4 Hz) suggest that the glucose group

![Figure 2](image-url)
must be attached to C-1. As shown in Figure 2, long-range correlations were observed between the following: H-4 (Me) and C-2, C-3 (C=O); H-5 (CH₃) and C-1, C-2; H-6 (CH₃) and C-1, C-2, C-3. According to the literature, it was named A. pinnata D (Table 2; Figure 1). Compound 5 has the molecular formula of \( \text{C}_{14}\text{H}_{22}\text{O}_5 \) according to HR-ESI-MS at \( m/z \) 270.1693 [M+H]⁺. The \(^1\)H-NMR data of 5 displayed one group of ABX coupling systems with proton signals at 6.94 (1H, s), 6.78 (1H, m) and 6.78 (1H, m), 2 methyl groups \( \delta_H 3.84 \) (3H, s), 0.90 (3H, t, \( J = 6.6 \) Hz), 4 methylene protons at \( \delta_H 3.47 \) (1H, dd, \( J = 11.3, 3.8 \) Hz), 3.35 (2H, m), 3.30 (1H, m), 1.54 (2H, m), 1.33 (2H, m), 2 methine protons at \( \delta_H 4.19 \) (1H, d, \( J = 6.6 \) Hz), 3.66 (1H, m). Combined with DEPT-135, HSQC and \(^{13}\)C-NMR data, compound 5 presented signals for 14 carbons, including 6 aromatic carbons (\( \delta_C \) 149.1, 147.4, 132.3, 121.5, 111.8, 116.0), 2 methyl carbons (\( \delta_C \) 56.4, 14.2), 2 tertiary carbon signals (\( \delta_C \) 83.8, 77.2), and 4 methylene carbon signals (\( \delta_C \) 69.7, 64.0, 33.0, 20.4). In the HMBC spectrum, the correlations between \( \delta_C 83.8 \) (C-7) and H-1' and between \( \delta_C 69.7 \) (C-1') and \( \delta_H 4.19 \) (1H, d, \( J = 6.6 \) Hz) suggest that the butoxy group must be attached to C-7. As shown in Figure 2, long-range correlations were observed between the following: H-7 (CH) and C-8, C-9, C-1', C-1; H-4' (Me) and C-3', C-2'; H-2' (CH₂) and C-1', C-3', C-4'; OCH₃ and C-3, C-4. This evidence indicates that compound 5 can be identified as 7-O-butylnuiaacylglycerol.

It has been reported that in the case of syringoylglycerol and guaiacylglycerol derivatives, the coupling constant between H-7 and H-8 was approximately 5 Hz for the erythro isomer and 7 Hz for the threo isomer. Based on the obtained data, the structure was established as threo-7-O-butylnuiaacylglycerol and named A. pinnata E (Table 1; Figure 1).

The 13 known compounds were identified by comparing their spectroscopic data with those reported in the literatures as \((7R,8S,7'R,8'S)-4,9,4',9'-tetrahydroxy-3,3'-dimethoxy-7,7'-epoxylignan 9-O-\beta-D-glucopyranoside (6),^15\) (-)-syringaresinol (7),^16\) (-)-isolarisiresinol 3α-O-\beta-D-glucopyranoside (8),^17\) (-)-lyoniresinol-3α-O-\beta-D-glucopyranoside (9),^18\) (+)-lyoniresinol-3α-O-\beta-D-glucopyranoside (10),^19\) (+)-isolariciresinol 9'-O-\beta-glucopyranoside (11),^20\) cyclo(L-Pro-L-Phe) (12),^21\) cyclo(L-Pro-D-Ile) (13),^21\) cyclo((S)-Pro-(R)-Leu) (14),^22\) 4-(2-formyl-1H-pyrrol-1-yl)butanoic acid (15),^23\) 2-formyl-5-(butoxymethyl)-1H-pyrrole-1-butanoic acid (16),^24\) butyl 2-pyrrolidone-5-carboxylate (17),^25\) 4'-hydroxy-N-(4-hydroxy-3-methoxybenzoyl)-3',5'-dimethoxybenzamide (18).^26\

CONCLUSIONS

In recent years, Feng et al. found the cytoprotective effect of phenethylflavone (A. pinnata A) on the oxidative damage of Caco-2 cells induced by hydrogen peroxide (H\(_2\)O\(_2\)).^27\) Through literature research, it has been found that these nitrogen-containing compounds have a synergistic effect on the intestinal flora of mice^28\) and display neuroprotective effects against hydrogen peroxide (H\(_2\)O\(_2\))-induced neuronal cell damage in human neuroblastoma SH-SY5Y cells.^29\) Therefore, these known compounds may have potential biological research value and great chemical taxonomic value for A. pinnata.

EXPERIMENTAL

General experimental procedures. NMR spectra were measured on a Bruker AV-400 spectrometer (Bruker Company, Waltham MA, USA) with TMS as an internal standard. High-resolution ESI-MS mass spectra were obtained on an AB SCIEIX Triple-TOFTM 5600\(^+\) instrument (A.B. Company, Milwaukee, WI, USA). UV spectra were recorded on a PerkinElmer Lambda UV-365 instrument (PE Company, Waltham MA, USA). IR spectra were recorded on a PerkinElmer Spectrum Two spectrometer (PE Company, Waltham MA, USA) with KBr disks. Preparative HPLC (515–2414, Waters, Milford, CT,
USA) was performed on a 5C18 MS-II (10 µm, 20×250 mm, cat. no.: 38024–01, COSMOSIL, Tokyo, Japan). Silica gel (200–300 mesh, Haiyang Co, Qingdao, China) and ODS (50 µm, AAG12S50, YMC Company, Kyoto, Japan) were used for column chromatography. Detectors (2424, ELS, Waters and 2998, PDA, Waters) were used in the HPLC. Precoated silica GF 254 plates (Haiyang Company, Qingdao, China) were used for the TLC analysis. All solvents were of analytical grade (TianJinfuyu Company Ltd., TianJin, China).

Plant Material. A. pinnata fruits were collected from Guangxi in China during September 2017 and authenticated by Prof. Weiming Wang of the HeilongJiang Research Institute of Chinese Medicine. The fruitage (Guangxi-201709001) was deposited at the HeilongJiang Research Institute of Chinese Medicine.

Extraction and Isolation. Fresh A. pinnata fruits (30.0 kg) were extracted with 70% EtOH (200 L×3 h×3 times). The combined extract was concentrated in vacuum to obtain the residue (3.0 kg), which was dissolved in H₂O (12 L) and extracted with petroleum, CHCl₃, EtOAc and n-butanol (12 L×3 h×5 times) in sequence. The 4 eluents were concentrated in vacuo to obtain 109.0 g, 123.0 g, 205.0 g, and 380.0 g. In this research, we chose the n-butanol layer as the follow-up research object. The n-butanol extract was subjected to column chromatography on silica gel (4460.0 g) using CH₂Cl₂/MeOH (20:1 (80.0 L), 10:1 (110.0 L), 5:1 (120.0 L), 3:1 (100.0 L), 2:1 (80.0 L) and 1:1 (60.0 L), v/v) elution to obtain 6 fractions: A (36.0 g), B (96.7 g), C (90.2 g), D (40.1 g), E (21.2 g), and F (20.1 g). Each fraction was analyzed using TLC and HPLC, and similar fractions were combined to obtain A1–A6, B1–B5, C1–C6, D1–D6, E1–E10, and F1–F6. Fraction A2 (21.7 g) was eluted by Rp-18 (600.0 g) (MeOH/H₂O 2:8 (1.4 L)→3:7 (2.0 L)→4:6 (2.7 L)→5:5 (2.0 L)→6:4 (2.0 L)→7:3 (1.4 L)→8:2 (1.4 L)→9:1 (0.8 L)→1:0 (1.0 L), v/v) to afford 9 subfractions (subfractions A2–1–A2–9). Subfractions A2–1, A2–2, and A2–5 were further purified by preparative RP-HPLC (55% MeOH/H₂O, flow rate 5 mL/min) to obtain 1 (16.6 mg, tᵣ = 28 min), 2 (17.1 mg, tᵣ = 45 min) and 3 (18.0 mg, tᵣ = 23 min), respectively. Fraction B5 (8.0 g) was eluted by Rp-18 (600.0 g) (MeOH/H₂O 2:8 (1.4 L)→3:7 (2.0 L)→4:6 (2.7 L)→5:5 (2.7 L)→6:4 (2.0 L)→7:3 (1.4 L)→8:2 (1.4 L)→9:1 (0.8 L)→1:0 (1.0 L), v/v) to afford 9 subfractions (subfractions B5–1–B5–9). Subfractions B5–1 were further purified by preparative RP-HPLC (20% MeOH/H₂O, flow rate 5 mL/min) to give 4 (16.1 mg, tᵣ = 30 min). Subfraction B5–2 was further purified by preparative RP-HPLC (45% MeOH/H₂O, flow rate 5 mL/min) to give 5 (15.9 mg, tᵣ = 35 min).

A. pinnata A (1) Light yellow oil. UV (MeOH) λmax 205, 272, 351 nm; IR (KBr) 3412, 2920, 2851, 1654, 1607, 1577, 1512, 1447, 1384, 1260, 1178, 1121, 1046 cm⁻¹; HR-ESI-MS m/z 407.1125 [M+H]⁺ (calcd for C₂₃H₁₈O₇, 407.1125).

A. pinnata B (2) Yellow amorphous powder. IR (KBr) 3426, 2937, 2834, 1770, 1634, 1368, 1181, 1094, 935 cm⁻¹; HR-ESI-MS m/z 189.1117 [M+H]⁺ (calcd for C₉H₁₆O₄, 189.1117).
A. pinnata C (3) White amorphous powder. IR (KBr) 3398, 3340, 1705, 1627, 1172, 898 cm\(^{-1}\); HR-ESI-MS \(m/z\) 251.1125 [M+H]\(^+\) (calcd for C\(_{10}\)H\(_{18}\)O\(_7\), 251.1125).

A. pinnata D (4) Yellow amorphous powder. IR (KBr) 3411, 3305, 1710, 1163, 1156, 1132, 927 cm\(^{-1}\); HR-ESI-MS \(m/z\) 295.1385 [M+H]\(^+\) (calcd for C\(_{12}\)H\(_{22}\)O\(_8\), 295.1385).

A. pinnata E (5) Colorless oil. UV (MeOH) \(\lambda_{\text{max}}\) 204, 229, 280 nm; IR (KBr) 3421, 2929, 1631, 1612, 1518, 1454, 1432, 1372, 1279, 1156, 1122, 1094, 1035, 853, 773 cm\(^{-1}\); HR-ESI-MS \(m/z\) 270.1693 [M+H]\(^+\) (calcd for C\(_{14}\)H\(_{22}\)O\(_5\), 270.1693).
