EXPERIMENTAL

General Information

Infrared spectra were recorded on a JASCO FT-IR 4100 spectrometer with an ATR unit. Absorbance frequencies are recorded in reciprocal centimeters (cm⁻¹). High-resolution mass spectra (HRMS) were obtained from a Thermo Scientific Exactive for electrospray ionization (ESI). HRMS data are reported as m/e (relative intensity), with accurate mass reported for the molecular ion [M+Na]⁺, [M+H]⁺. ¹H and ¹³C NMR spectra were recorded on a JEOL ECA-500 spectrometer operating at either 500 MHz (¹H NMR) or 125 MHz (¹³C NMR) in CDCl₃ as a solvent. Chemical shifts for NMR were reported in ppm relative to the chemical shift of the residual solvent (¹H NMR, 7.26 ppm for CDCl₃; ¹³C NMR, 77.0 ppm for CDCl₃). Multiplicities are indicated as; br (broad), s (singlet), d (doublet), t (triplet), q (quartet), or m (multiplet). Coupling constants (J) are reported in Hertz (Hz).

All reactions sensitive to oxygen or moisture were performed under an atmosphere of dry argon in flame-dried glassware. Dry THF (41001-85), CH₂Cl₂ (1138-85), CH₃CN (01837-05), and methanol (25506-05) was purchased from KANTO Chemical Industries Ltd, in anhydrous Grade. Chemical reagents were commercial grades and were used without any purification unless otherwise noted.

Flash chromatography was performed with Silica Gel 60N (spherical, neutral), purchased from KANTO Chemical Industries Ltd, unless otherwise noted. Analytical thin layer chromatography (TLC) was performed using commercial silica gel plates (E. Merck, Silica Gel 60 F₂₅₄).
(1R*,2R*,5R*)-1-hydroxy-2-(methylthio)-6-oxabicyclo[3.2.2]non-8-ene-3,7-dione (3a)

To a solution of Tf$_2$NH (2.17 mmol) in CH$_2$Cl$_2$ (6.6 mL) was added a solution of 3-hydroxy-2-pyrone 1a (148 mg, 1.32 mmol) and acetate 2 (548 mg, 1.72 mmol) in CH$_2$Cl$_2$ (6.6 mL) at −78 °C. The mixture was stirred for 2 h at −30 °C. After completion of the reaction (by monitoring TLC), the reaction was quenched with sat. NaHCO$_3$ aq. and extracted with CH$_2$Cl$_2$, dried over MgSO$_4$ and concentrated in vacuo. The crude product was purified by silica gel column chromatography (Hexane/AcOEt = 2/1 as eluent) to give cycloadduct 3a (245 mg, 86%) as a white solid.
