SYNTHETIC STUDIES TOWARD CONCAVINE: SYNTHESIS OF THE BCD RING SYSTEM

Yosuke Komori, Akitoshi Kozen, and Masahiro Toyota*

Abstract – The BCD ring system of concavine is realized stereoselectively using a palladium-catalyzed cycloalkenylation to synthesize the CD ring and an intramolecular aza-Michael reaction to append the third ring.

Concavine (1), a diterpene alkaloid, was isolated from cultures of Clitocybe concave in 2005 by Nasini and coworkers.\textsuperscript{1} 1 contains an octahydropyrrolo[1,2-\textit{d}][1,4]oxazepine unit (AB ring part), a bicyclo[3.2.1]octane system (CD ring part), and five stereocenters, four of which are consecutive (Figure 1). Although weak, 1 shows antibacterial activities against on Bacillus cereus and B. subtilis.\textsuperscript{1}

In an effort to demonstrate the utility of our palladium-catalyzed cycloalkenylation,\textsuperscript{2} we applied this catalytic cyclization process to the synthesis of 1. Unfortunately, attempts to stereoselectively introduce various carbon units on amine 2 using a variety of established procedures were unsuccessful; for instance, undesired stereoisomer 3 was produced as a single stereoisomer (Scheme 1).\textsuperscript{3}
To obtain a potential intermediate of 1, we focused on an intramolecular aza-Michael reaction as the key step. Scheme 2 shows the retrosynthesis. 1 could be synthesized through a series of functional group interconversions of tricyclic intermediate 4, which could be prepared from amine 5 by an intramolecular aza-Michael reaction. Requisite substrate 5 could be provided using the structural characteristics of bicyclo[3.2.1]octane 6, which could be obtained from cross-conjugated silyl enol ether 7 by means of a palladium-catalyzed cycloalkenylation.

Bicyclo[3.2.1]octane 6, the CD ring part of 1, was efficiently constructed in 78% yield using a palladium-catalyzed cycloalkenylation of 75 in the presence of 5 mol % of Pd(OAc)2 under one atmosphere of oxygen.2 To introduce the methylamine moiety on enone 6 stereoselectively, the Nagata reagent was adopted.6 Hydrocyanation proceeded from the convex face of bicyclo[3.2.1]octane 6 to give desired cyanide 8 in 63% yield as a single stereoisomer. After protection of the carbonyl moiety of 8...
(83%), the cyanide moiety of 9 was reduced followed by protection of the corresponding primary amine with 2-nitrobenzenesulfonyl chloride (NsCl) and Et₃N furnished sulfonamide 10 in 84% yield over two steps (Scheme 3).

![Scheme 3](image)

To determine the stereochemistry of 10, the p-methoxybenzyl (PMB) group of the primary alcohol of 10 was removed with DDQ to give alcohol 11 in 89% yield (Scheme 4). The relative stereochemistry of 11 was established by employing NOESY correlations (Figure 2).

![Scheme 4](image)

N-Alkylation of sulfonamide 10 with TBS-protected 2-bromoethanol afforded TBS ether 12 (73%), which was subjected to deprotection with aqueous DDQ to afford alcohol 13 in 69% yield. Swern
oxidation of the primary alcohol of 13 followed by Emmons olefination of the corresponding aldehyde provided requisite substrate 5 for the second key reaction in the present synthesis. An intramolecular aza-Michael reaction of 5 was performed with PhSH and K$_2$CO$_3$, leading to desired tricyclic compound 4 as a 6:1 mixture of diastereoisomers. Each diastereoisomer was easily separated by silica gel flash column chromatography. The relative stereochemistry of major diastereoisomer 4 was determined by NOE experiment (Figure 3).

The stereochemical outcome observed in the intramolecular aza-Michael reaction of 5 is attributed to the interaction of the olefinic hydrogen with the equatorial hydrogen in the conformation B (Figure 4). This interaction is absent in conformation A, producing desired cyclization product 4.
In conclusion, tricyclic compound 4 is available in ten steps from cross-conjugated silyl enol ether 7. The conversion of 4 into 1 requires the construction of a 1,4-oxazepane ring. Schemes to accomplish this goal are currently under investigation.

**EXPERIMENTAL**

Unless otherwise noted, all reactions were performed in an oven-dried glassware, sealed with a rubber septum under an atmosphere of argon. Anhydrous THF, CH₂Cl₂ and Et₂O were purchased from Kanto Chemical Co., Inc. Et₃N was distilled from CaH₂ prior to use. DMSO and DMF were distilled from CaH₂ under reduced pressure. Benzene was distilled from P₂O₅. Oxalyl chloride was distilled and immediately used. Unless otherwise mentioned, materials were obtained from commercial suppliers and used without further purification. Organic extracts were dried by being stirred over anhydrous MgSO₄ or Na₂SO₄, filtered through Celite, and concentrated under reduced pressure with the aid of a rotary evaporator. Flash column chromatography was carried out using Cica 60 (spherical, neutral) silica gel. Reactions and chromatography fractions were analyzed employing precoated silica gel 60 F₂₅₄ plates (Merck). Compounds were visualized using an ultraviolet lamp (254 nm) and/or by staining with p-anisaldehyde (in EtOH), phosphomolybdic acid (in EtOH) or ammonium molybdate (in 10% H₂SO₄). IR spectra were measured on a SHIMADZU FT-IR 8300 spectrophotometer. ¹H NMR spectra were recorded on Varian 400 MR (400 MHz) spectrometer with CHCl₃ (δ 7.26) as an internal standard. ¹³C NMR spectra were recorded on Varian 400 MR (100 MHz) spectrometers with CHCl₃ (δ 77.16) as an internal standard. Mass spectra were recorded on JEOL JMS-AX 700 spectrometers.

(1S*,5S*)-5-(4-Methoxybenzyloxymethyl)-7-methylene-bicyclo[3.2.1]oct-3-en-2-one (6). To a solution of 7 (204.6 mg, 0.511 mmol) in DMSO (5.1 mL) was added Pd(OAc)₂ (5.9 mg, 0.026 mmol) at rt. The resulting mixture was stirred under one atmosphere of oxygen at 45 °C for 41.5 h. The solution was diluted with EtOAc and filtered through Celite. Water (15 mL) was added and the layers were separated. The aqueous layer was extracted three times with hexane-EtOAc (1:1 v/v). The combined organic layers
were washed with brine and dried over MgSO₄. Removal of the solvent and column chromatography of the residue with hexane-EtOAc (4:1 v/v) as an eluent afforded 6 (113.7 mg, 78%) as a colorless oil. ¹H NMR (CDCl₃, 400 MHz) δ 1.81 (ddd, J = 11.2, 4.8 and 2.0 Hz, 1H), 2.13 (dd, J = 10.8 and 2.4 Hz, 1H), 2.12 (d, J = 16.0 Hz, 1H), 2.46 (ddd, J = 16.0, 2.4 and 2.4 Hz, 1H), 3.46 (d, J = 4.8 Hz, 1H), 3.50 (d, J = 9.2 Hz, 1H), 3.54 (d, J = 8.8 Hz, 1H), 3.82 (s, 3H), 4.52 (s, 2H), 5.05 (s, 1H), 5.28 (s, 1H), 5.83 (dd, J = 9.6 and 1.2 Hz, 1H), 6.90 (d, J = 8.8 Hz, 1H), 7.14 (dd, J = 9.6 and 1.6 Hz, 1H) and 7.27 (d, J = 8.0 Hz, 2H).

(1S*,2S*,5S*)-1-(4-Methoxybenzylxoymethyl)-6-methylene-4-oxobicyclo[3.2.1]octane-2-carbonitride (8). To a stirred solution of enone 6 (377.8 mg, 1.33 mmol) in benzene (10 mL) was added 1 M solution of Et₂AlCN in toluene (2.0 mL, 2.0 mmol) at rt. After 2 h, the mixture was poured into 15% NaOH solution, the layers were separated. The aqueous layer was extracted three times with EtOAc. The combined organic layers were washed with brine and dried over MgSO₄. Removal of the solvent and column chromatography of the residue with hexane-EtOAc (2.5:1 v/v) afforded 8 (261.8 mg, 63%) as a colorless oil. (1S*,4S*,5S*)-5-(4-Methoxybenzylxoymethyl)-7-methylene-4-[N-(2-nitrobenzenesulfonyl)-aminomethyl]-bicyclo[3.2.1]octan-2-one ethylene acetal (10). To a suspension of LiAlH₄ (18.6 mg,
0.490 mmol) in Et$_2$O (1 mL) was added dropwise a solution of 9 (50.0 mg, 0.141 mmol) in Et$_2$O (5 mL) at 0 °C. The mixture was allowed to warm to rt. After 2 h, the reaction was quenched by successive addition of water (0.02 mL), 15% NaOH solution (0.02 mL) and water (0.06 mL) at 0 °C. MgSO$_4$ was added and the mixture was filtered through Celite. Removal of the solvent gave a colorless oil, which was used immediately in the next step.

To a solution of the above crude product in CH$_2$Cl$_2$ (5 mL) were added Et$_3$N (0.10 mL, 0.72 mmol) and a solution of NsCl (31.4 mg, 0.142 mmol) in CH$_2$Cl$_2$ (1 mL). After 2 h, water (2 mL) was added. The layer was extracted three times with CH$_2$Cl$_2$. The combined organic layers were washed with brine and dried over Na$_2$SO$_4$. To a suspension of NaH (washed three times with hexane, 47.0 mg, 1.96 mmol) in THF (3 mL) was
added triethyl phosphonoacetate (0.45 mL, 2.27 mmol) at 0 °C. The solution was allowed to warm to rt
and stirred for 30 min. A solution of the above aldehyde (367.8 mg, 0.633 mmol) in THF (4 mL) was
added at 0 °C. After an hour, the reaction was quenched with water. The mixture was extracted three
times with EtOAc. The combined organic layers were washed brine and dried over Na\(_2\)SO\(_4\). Removal of
the solvent and column chromatography of the residue with hexane-EtOAc (2:1) as an eluent afforded 5
