Abstract – A synthesis of *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**5**) was achieved in a highly efficient manner *via* trifluoroacetic acid catalyzed cyclization of formyliminium ion (**4**), which was produced by imination of 2-(2-thienyl)ethylamine (**1**) and a carbonyl compound (**2**) using titanium(IV) tetraisopropoxide followed by formylation with acetic-formic anhydride in a one-pot procedure. This modified Pictet-Spengler reaction provides a convenient method for preparing 4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**6**) possessing various substituents at C-4.

INTRODUCTION

The Pictet-Spengler reaction is a well-known method for constructing 1,2,3,4-tetrahydroisoquinoline and heteroaryl homologs, which constitute important motifs of naturally occurring bioactive compounds.¹ The synthesis of these compounds by the Pictet-Spengler reaction consists of two steps: the formation of an imine by condensation of an aryethylamine with a carbonyl compound, and the acid-catalyzed cyclization of the *in situ* generated imine. We recently modified both the imination and the cyclization steps. We discovered that imination in titanium(IV) tetraisopropoxide² proceeded in a highly effective manner and that cyclization readily occurred in trifluoroacetic acid (TFA) when the imine was converted

into a formyliminium ion.³ This modified method effectively enables the Pictet-Spengler reaction to be applied to ketones, which is known to be difficult,⁴ providing 1,1-disubstituted 1,2,3,4-tetrahydroisoquinolines³ and 1,1-disubstituted tetrahydro- β -carbolines.⁵ This modified method also induced the Pictet-Spengler reaction of phenylethylamine with aldehydes, although the benzene ring lacks electron-donating groups, providing 1-substituted 1,2,3,4-tetrahydroisoquinolines in high yields.⁶ Yokoyama *et al.* reported that no cyclization of imines proceeded in TFA.⁷

In this paper we describe the modified Pictet-Spengler reaction of 2-(2-thienyl)ethylamine (**1**) with aldehydes and ketones, which should provide a convenient method for preparing 4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines⁸ with various substituents at the C-4 position. Some 4-substituted derivatives have been reported to have biological activities. For example, 4-methyl-4-phenyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine (**6k**) is a known *N*-methyl-D-aspartate (NMDA) antagonist,⁹ and 4-aryl-5-aryl derivatives containing this ring system are glucose-6-phosphatase catalytic enzyme inhibitors.¹⁰

RESULTS AND DISCUSSION

The Pictet-Spengler reaction was carried out in a one-pot procedure as follows (Scheme 1). 2-(2-Thienyl)ethylamine (**1**) (1.2 mol equiv) and a carbonyl compound (**2**) (1.0 mol equiv) were condensed at 80 °C in titanium(IV) tetraisopropoxide (1.8 mol equiv) for 3 h, and the *in situ* formed imine (**3**) was treated with acetic-formic anhydride (100 mol equiv) at 70 °C for 2 h to produce the formyliminium ion (**4**). To this solution, a large excess (100 mol equiv) of TFA was added at 0 °C and then the solution was heated at 70 °C for an appropriate time, thus producing *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**5**). This modified Pictet-Spengler reaction was applied not only to aldehydes (**2a-j** and **2q**) and but also to ketones (**2k-o**), which produced various derivatives with different substitution patterns at the C-4 position. The structure of the product (**5**) was assigned by observation of the characteristic C₄ carbon signals at δ 52.6 and 58.8 ppm (in the case of **5a**) in the ¹³C NMR spectrum. The results are summarized in Table 1.

Scheme 1: Synthesis of 4-substituted 4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines using modified Pictet-Spengler reaction

Benzaldehyde (**2a**), cyclopropanecarboxaldehyde (**2h**), cyclopentanecarboxaldehyde (**2i**), and cyclohexanecarboxaldehyde (**2j**) gave the corresponding 4-monosubstituted *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**5a**, **5h**, **5i**, **5j**) in yields of 93, 72, 83, and 91%, respectively. The cyclization of imines (**3a** and **3j**), as already reported by Madsen *et al.*, proceeded in TFA at room temperature, but the yields of the products (**5a** and **5j**) were only 24% and 8%, respectively.⁹ This indicated that our modified method has an advantage over the conventional one.

On the other hand, paraldehyde, a trimer of acetaldehyde (**2b**) and propionaldehyde (**2c**) gave the expected products (**5b**, **5c**), although in 24, 12% yields, respectively. This unsatisfactory result of the reaction may be attributed to the high reactivity of these aldehydes for aldol condensation. In fact, the reaction of **2c** yielded the *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine (**8c**) having a pent-2-en-2-yl side chain at the C4 as a major product in 31% yield. The formation of **8c** is readily explained by assuming the formation of the imine (**7c**) that is formed from 1 mol equiv of amine (**1**) and 2 mol equiv of propionaldehyde (**2c**) as shown in Scheme 1. Other alkyl aldehydes, *n*-butanal (**2d**), *n*-pentanal (**2e**), *n*-hexanal (**2f**), and *n*-heptanal (**2g**), gave the similar results, thus yielding the corresponding 4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine derivative (**5d**, **5e**, **5f**, **5g**) in yields of 49-56% together with the minor one (**8d**, **8e**, **8f**, **8g**) in yields of 12-14%.

Acyclic ketones such as acetophenone (**2k**), acetone (**2l**), and 2-butanone (**2m**) gave the corresponding, 4,4-disubstituted *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**5k**, **5l**, and **5m**) in high yields (74-84%). Cyclic ketones such as cyclopentanone (**2n**) and cyclohexanone (**2o**) also yielded the corresponding 4-spirocycloalkyl *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**5n**) and (**5o**) in yields of 65% and 51%, respectively. The gradually decreased yields observed in the reactions of cyclic ketones suggested that the cyclization was sensitive to steric congestion. In the case of benzophenone

(**2p**) possessing two bulky phenyl groups, the expected product (**5p**) was not obtained at all. We previously showed that the reaction of tryptamine with benzophenone (**2p**) under similar conditions yielded *N*-formyl-1,1-diphenyl-1,2,3,4-tetrahydro- β -carboline, albeit in low yield (24%),⁴ indicating that the inhibition of the reaction is attributable to the steric hindrance in the cyclization step, not in the imination one.

Interestingly, paraformaldehyde (**2q**) afforded *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine (**5q**), the skeletal compound of the ring system, in yield of 69%.

Alkaline or acidic hydrolysis of *N*-formyl-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**5** and **8**) afforded the corresponding 4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**6** and **9**) in excellent to good yields as shown in Table 2.

The 4-methyl-4-phenyl derivative (**6k**) of the NMDA antagonist was prepared previously in a multi-step operation but in low overall yield (27%).⁹ This method gave **6k** in 84% overall yield by these simple manipulations.

Thus, the modified Pictet-Spengler reaction of 2-(2-thienyl)ethylamine (**1**) with carbonyl compounds provides a convenient and effective method for synthesizing 4,5,6,7-tetrahydrothieno[3,2-*c*]pyridines (**6**) with various substituents at the C-4 position. Particularly, this modified method is of great value in preparing the sterically congested 4,4-disubstituted derivatives by simple one-pot manipulation.

EXPERIMENTAL

Unless otherwise noted, the following procedures were adopted. Melting points were taken on a Yanagimoto SP-M1 hot-stage melting point apparatus and are uncorrected. IR spectra were measured as KBr disks with a HORIBA FT-710 spectrophotometer or Nicolet iS10 spectrophotometer and the values are given in cm^{-1} . NMR spectra were measured on a JEOL JNM-AL 300 (¹H-NMR, 300 MHz; ¹³C-NMR, 75 MHz) NMR spectrometer in CDCl₃ or DMSO-*d*₆ with tetramethylsilane as an internal standard and the chemical shifts are given in δ values. LR-MS were taken on JMS-AM20, and high resolution MS (HR-MS) on a JEOL JMS-D300 spectrometer at 70 eV (EI-MS) using direct inlet systems. HRFAB-MS spectra were recorded with JEOL-MS700 spectrometer using glycerol as a matrix. Elemental analyses were recorded on a ThermoFisherScientific model EA1112 IRMS NC-plus CHNS. TLC was performed

on Merck precoated Silica gel 60 F₂₅₄ plates (Merck). Column chromatography was carried out with silica gel (Wakogel C-200). The organic extract from each reaction mixture was washed with brine, dried over anhydrous Na₂SO₄, and concentrated *in vacuo* to dryness.

The Pictet-Spengler reaction of 2-(2-thienyl)ethylamine (1) with carbonyl compound (2) : General procedure.

Method A: A mixture of **1** (1.00 g, 7.86 mmol), carbonyl compound (**2**) (6.4 mmol) and Ti(O-*i*Pr)₄ (3.2 g, 11.3 mmol) was heated at 80 °C for 3 h under an argon atmosphere. To the reaction mixture, a solution of acetic-formic anhydride [prepared from HCO₂H (29.46 g, 0.64 mol) and Ac₂O (65.34 g, 0.64 mol)] was added at 0 °C, then the mixture was heated at 70 °C for 2 h. To this reaction mixture CF₃CO₂H (72.97 g, 0.64 mol) was added and heated at 70 °C for 3-16 h (Table 1). The reaction mixture was diluted with MeOH (100 mL) and passed through a short SiO₂ column (CHCl₃-MeOH) to remove TiO₂. The eluent was concentrated *in vacuo* to *ca.* 50 mL and the residue was extracted with CHCl₃. After removal of the solvent of extract *in vacuo*, the residue was purified by chromatography over SiO₂ eluted with AcOEt-hexane (1:1-1:3) to give **5**.

Method B: A mixture of **1** (1.00 g, 7.86 mmol), carbonyl compound (**2**) (7.86 mmol) and Ti(O-*i*Pr)₄ (2.68 g, 9.43 mmol) was heated at 80 °C for 2 h under an argon atmosphere. To the reaction mixture, a solution of acetic-formic anhydride [prepared from HCO₂H (9.05 g, 196.5 mmol) and Ac₂O (20.1 g, 196.5 mmol)] was added at 0 °C, then the mixture was heated at 70 °C for 0.5 h. To this reaction mixture CF₃CO₂H (22.41 g, 196.5 mmol) was added and heated at 70 °C for 1.5 h. The reaction mixture was diluted with MeOH (100 mL) and passed through a short SiO₂ column (CHCl₃-MeOH) to remove TiO₂. The eluent was concentrated *in vacuo* to *ca.* 50 mL and the residue was extracted with CHCl₃. After removal of the solvent of extract *in vacuo*, the residue was purified by chromatography over SiO₂ (AcOEt-hexane (2:1-1:3)) to give **5** and **8**.
